I. Introduction

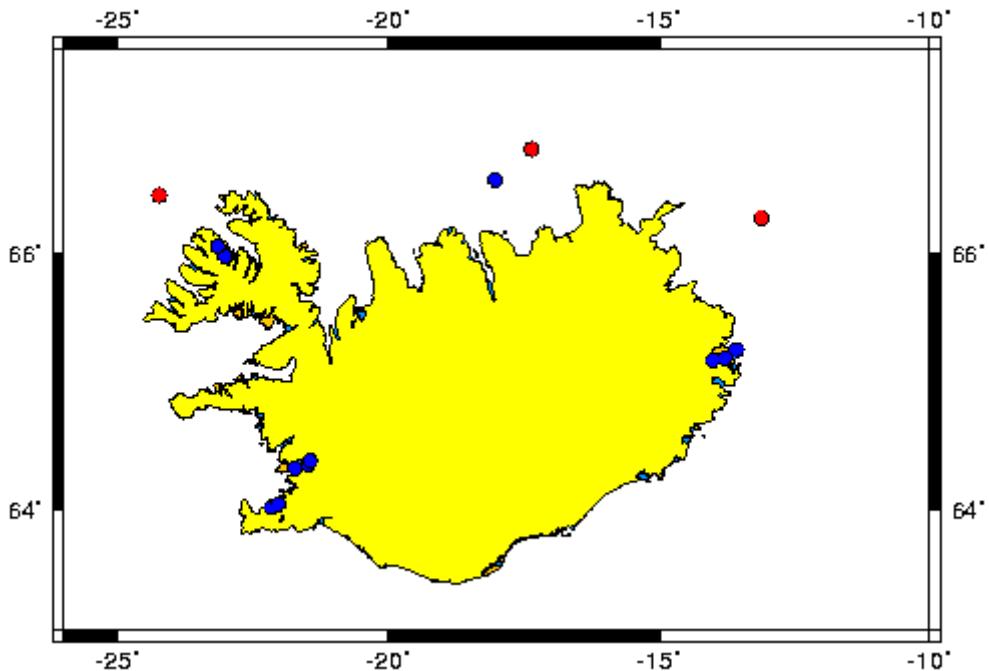

This report contains the results of the annual monitoring of heavy metals and organochlorine analyses for blue mussel (*Mytilus edulis*), collected in the waters around Iceland in 2006, as well as for cod (*Gadus morhua*), which collected in Icelandic territorial waters in 2007. Annual monitoring of trace metals in the marine biota around Iceland began in 1989 and the monitoring of organochlorine compounds a few years later, in 1991. Several reports have already been published on this matter (1-13). To meet the requirements of the OSPAR (Oslo and Paris agreement) and the AMAP (Arctic Monitoring Assessment Program), data has been submitted to the ICES databank (ices.dk), the first data from 1989. The project is supervised by the Environment and Food Agency in Iceland and financed by The Ministry for the Environment as well as the Ministry of Fisheries. Matís ohf is the coordinator for the marine biota monitoring and responsible for methods relating to sampling, preparation and analysis of samples. The samples were analyzed at the Matís and at the Department of Pharmacology and Toxicology at the University of Iceland.

II. Sampling and preparation of samples

The Marine Research Institute handles all sampling, whereas the Matís is responsible for the storage of samples, preparation and chemical analysis.

2.1 Sampling

Using standard sampling guidelines (JMP, ICES and OSPAR), the sampling of cod (30-45 cm length, 3 samples (N-NW(1), N-NW(2) and NE) was carried out in the annual bottom trawl survey in March 2007. Blue mussel, 4-6 cm length, was collected from 11 sites around the country in August/September 2006. Sampling sites for cod and blue mussel are shown in Figure 1 and coordinates are given in appendix I and II. Icelandic waters have been divided into five main locations (N-NW, NE, SE-E, S, and SW) (6).

*Figure 1. Locations for sampling of cod (*Gadus morhua*) (red dots) 2007 and blue mussel (*Mytilus edulis*) (blue dots) 2006.*

2.2 Preparation of samples prior to analysing

Each sample of mussel contained 50 ± 5 individuals. Each mussel was weighed and its length (4-6 cm), height and width measured. The flesh and the shell were then weighed separately (Appendix I). After each sample (50 individuals) had been homogenized it was kept frozen until the analysis took place.

30-45 cm long cod was selected, each sample containing 25 ± 5 individuals. At the time of the sampling, the total weight as well as the gender of each fish was determined, livers were put in pre-weighed and pre-cleaned glass jars and, finally, the fish was gutted. All samples were kept frozen until further preparation for analysis took place. Later, the otoliths were removed for age determination, the fish was filleted, skinned, and the flesh weighed (Appendix II). Finally, each sample of flesh (25 ± 5 individuals) was homogenized. The livers of each cod sample were divided into sub samples, according to the weight of the livers. All liver samples were homogenized and kept frozen until analysis took place.

III. Analysis

3.1 Metals and organic contaminants in biota

The trace metal analysis of lead, cadmium, copper, zinc, mercury, arsenic and selenium was carried out at Matís, as well as analysis of the supporting parameters, dry matter and fat. The following organic compounds were analysed at the Department of Pharmacology and Toxicology at the University of Iceland: 11 PCBs, HCB, α -HCH, β -HCH and γ -HCH, p,p'-DDT o,p'-DDT, p,p'-DDE and p,p'-DDD, transnonachlor, α -chlordan, γ -chlordan, oxychlordan, Tox-26, Tox-50, Tox-62, PBDE-47, PBDE-99, and PBDE-100. Table 1 presents the samples and all the parameters measured in each sample.

Table 1. Parameters measured in different samples.

Species	Number of Samples	Number of Individuals	Type of Samples	Number of Group	Inorganic Contaminants	Organic Contaminants	Others
Mussel, 2006 (<i>Mytilus edulis</i>)	11	50	Whole soft body		Cu,Zn,As,Se Cd,Hg,Pb	X*	Dry matter and Fat
Cod, 2007 (<i>Gadus morhua</i>) Labels: Cod-N-NW (1) 07 Cod-N-NW (2) 07 Cod-NE 07	3	25	Flesh Liver	3 16	Hg Cu,Zn,As, Se,Cd,Pb	X*	Dry matter and Fat Dry matter and Fat

X*: PCB28, PCB31, PCB52, PCB101, PCB105, PCB118, PCB138, PCB153, PCB156, PCB170, PCB180, α , β , γ -HCH, HCB, p,p'-DDT, o,p'-DDT, p,p'-DDE, p,p'-DDD, Transnonachlor, α -Chlordan, γ -Chlordan, Oxychlordan, Tox-26, Tox-50, Tox-62, PBDE-47, PBDE-99, and PBDE-100.

3.2 Methods

Inorganic contaminants (Cd, Cu, Zn, As, Se, Hg, Pb) in the samples were determined by ICP-MS after mineralization of the samples with closed vessel acid digestion. Portions (up to 200 mg weighed to 0.1 mg) of freeze dried samples (cod liver was used wet) together with 3 ml HNO₃ were transferred to 50 ml Parr digestion bombs. Samples were digested for 6 hours at 180 °C (cod liver 18 hours at 180 °C). The

digested sample solutions were quantitatively transferred to 50 ml polypropylene tubes and diluted to 30 ml with Milli-Q water. The concentration of the different elements (Cd, Cu, Zn, As, Se, Hg, Pb) in these digests was determined by ICP-MS (Agilent 7500ce, Waldbronn, Germany). ^{45}Sc , ^{72}Ge , ^{115}In and ^{205}Tl were used as internal standards. The organochlorine compounds were analysed by GC-ECD using HP5890 Series II with an automatic injector (HP7673). A detailed description of the analyses of organic compounds and supporting parameters (dry matter and fat) is given in previous report (7).

3.3 Quality assurance

The quality of the metal analysis was checked in several ways. Certified reference materials are routinely treated and analysed in the same manner as the samples. Results for analysis of reference materials, recovery of standard additions and limits of detection are shown in Table 2 and 3 in appendix III. Also shown are Z scores for the reference materials. The trace analytical lab at the Matís has participated in Quasimeme annually with satisfactory results. Also, Matís participated in Quash with satisfactory results. The average field blank (C_B), derived from the sample field blanks, and three times its standard deviation ($3xS_B$), and were used to evaluate the limit of detection (LOD).

For **organic contaminants**, a solvent blank and sample of certified reference material was extracted with each batch of samples. A certified standard solution was also run with the samples to check own standards. The limit of detection was estimated to be 3 \times STDEV of the blanks. The Department of Pharmacology and Toxicology at the University of Iceland has participated in Quasimeme annually with satisfactory results. Results for analysis in certificate mussel and cod liver samples are presented in appendix III, Tables 4 and 5 along with relevant detection limits in Table 6.

IV. Results

This report contains data from the years 2006 and 2007 which has not been statistically evaluated in connection with previous results in order to evaluate time trend or spatial difference. However, there are apparently no obvious changes in contaminant concentrations pattern seen in previous years (see graphical representation in appendices VII and VIII). To be able to monitor long term trends and to indicate large scale spatial difference in the marine biota around Iceland, data from many years needs to be assessed with statistical models.

4.1 Biological variations

Figures 2a-d in appendix VI shows the biological variation in cod (*Gadus morhua*) 1990-2007, (average age, average weight of ungutted fish, average weight of liver, and average fat content in liver).

4.2 Heavy metals

Results for metals in blue mussel (2006) and cod (2007) are presented in Tables 7 and 8 in appendix IV. New data is presented along with data from previous years (1, 4-13) in figures 3a-c and 4a-c (Appendix VII) for blue mussel and in figures 6a, b and 7a-f (Appendix VIII) for cod, giving an overview of a period of 15-16 years. It should be noted that results for cod are on a wet weight basis but for mussel on a dry weight basis.

4.2.1 Blue mussel

Figures 3a-c in appendix VII show the average concentration of heavy metals in blue mussel 1991-2006, on a dry weight basis. The horizontal red line shows the ICES90 75% baseline (11). Figures 4a-c in appendix VII show average concentrations (dw), of heavy metals in blue mussel from different sampling sites, 1990-2006. Metal concentrations vary considerably between years and different locations. Concentration of arsenic is noticeably higher at Úlfsá, Skutulsfjordur than any other sample place for blue mussel. The results show low values for Hg in blue mussel when compared with ICES90 75% baseline values. Cu and Zn are close to these values but Cd is high in

blue mussel from Icelandic coasts, compared to other areas. This cadmium is considered to be of natural origin since no anthropogenic source is known.

4.2.2 Cod

Figures 6a-b in appendix VIII show the average heavy metal concentration in livers of 30-45 cm cod (wet weight), caught in Icelandic waters in March every year between 1990-2007. Figures 7a-f in appendix VIII show average concentrations (ww), of heavy metals in cod from different sampling sites, 1990-2007. Mercury is measured in the flesh and liver as well. Lead concentration was below the limits of detection in all samples. Variations in concentration between years and locations over the time interval can be seen. The concentration of heavy metals in cod from Icelandic waters is low compared to cod from other northern locations (6). As for the blue mussel the only exception is cadmium which is probably of natural origin reflecting the natural background values. However, the amount of cadmium in cod and other species in Icelandic costal waters is far below the TWI (Tolerable Weekly Intake) standard of WHO, even with heavy consumption (6).

4.3 Organic compounds

Results for organic compounds in blue mussel (2006) and cod (2007) are presented in appendix V, Tables 9 and 10. The results for cod are presented on a wet-weight basis but results for blue mussel are on a dry-weight basis. New data is shown along with data from previous years (1, 4-10) in figures 5a-b (Appendix VII) for blue mussel and in figures 8 and 9a-e (Appendix VIII) for cod, giving an overview of a 15-17 year period.

4.3.1 Blue mussel

Figures 5a-b in appendix VII show the concentration on a dry-weight basis of organic compounds in blue mussel from different locations in Iceland 1991-2006. The most common organochlorines found in blue mussel are PCBs. The concentration of PCBs in blue mussel found in Iceland are comparable with values found in mussels from remote areas of the west coast of United States and also similar to the lowest values found in mussels on the coast of the United Kingdom and Ireland (6). In general, concentration of HCH, HCB and DDE is low, close to the limit of detection.

4.3.2 Cod

Figure 8 in appendix VIII shows the average concentration on a wet-weight basis of organic compounds in livers of 30-45 cm cod, caught in Icelandic waters in March every year between 1991-2007. Figures 9a-e in appendix VIII show average concentrations (ww) of some organic compounds in cod from different sampling sites, 1991-2007. The sum of seven PCBs (PCB-28, PCB-52, PCB-101, PCB-118, PCB-138, PCB-153 and PCB-180) is about 90% of the 11 PCBs measured. The concentrations of the organic substances that are measured in cod from Icelandic waters correspond to the lowest values observed elsewhere (6).

V. Conclusion

This report contains the results of an evaluation of trace elements in Icelandic marine biota for the years 2006 and 2007. It adds to the information gathered every year to determine: if the concentration of trace elements is increasing, decreasing or not changing; if current situation is a cause for health concerns; and if the marine environment is being threatened by pollution.

This data has not been statistically evaluated in connection with previous results in order to evaluate time trend or spatial difference. However, there are apparently no obvious changes in contaminant concentrations pattern seen in previous years. **A full statistical analysis of all data is needed to confirm changes if any.** This was done in 1998 (6) but new data calls for a new evaluation. In addition, when comparing data of livers it is necessary to keep in mind the factors (i.e. fat, age, dw) that may affect the quantity and concentration of trace elements.

Iceland is unique in terms of geology, oceanography and meteorology. High levels of heavy metals, particularly cadmium, occur naturally in the environment in Iceland. Therefore, natural background values need to be kept in mind when comparing contamination levels with other countries.

VI. Acknowledgement

The authors would like to thank the Marine Research Institute, Iceland for providing the samples. We thank Svanhildur Hauksdóttir and Þorsteinn Ingvarsson for their technical laboratory assistance. Kristín Olafsdóttir, University of Iceland, Department of Pharmacology and Toxicology is also acknowledged for analysing the organic compounds.

Appendix VI.

Graphs of biological variation in Cod (*Gadus morhua*) 1990-2007

Biological variation in 30-45 cm Cod (*Gadus morhua*) from Icelandic waters in March 1990-2007

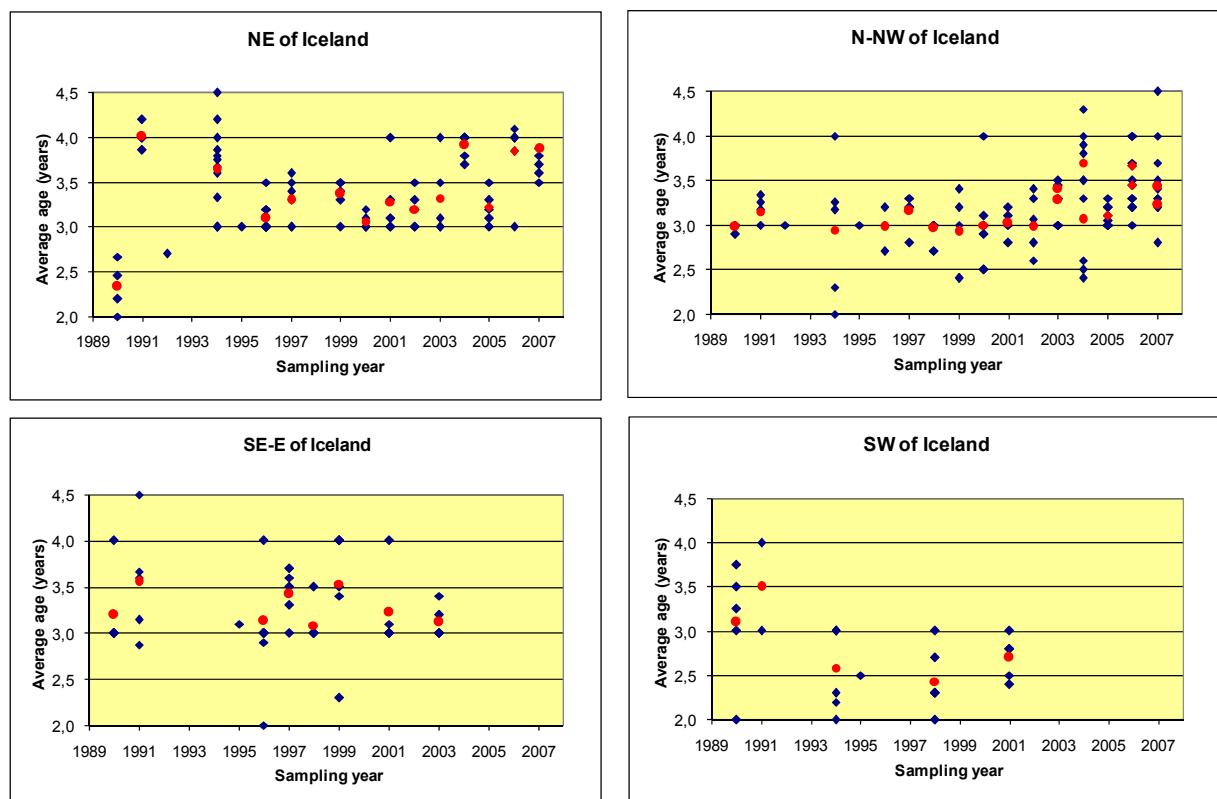

Figure 2a. Average age in 30-45 cm Cod (*Gadus morhua*) from Icelandic waters in March 1990-2007. The red dots represent the average values.

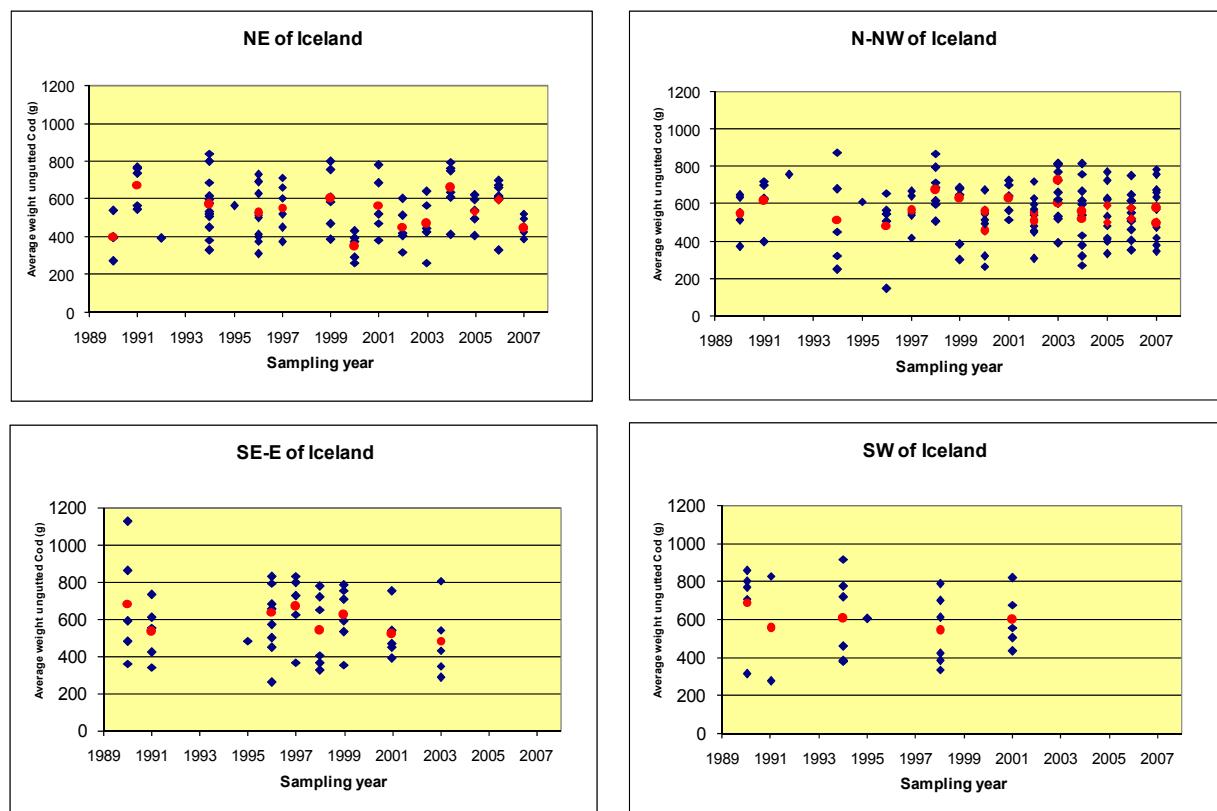

Figure 2b. Average weight ungutted Cod (*Gadus morhua*), 30-45 cm, from Icelandic waters in March 1990-2007. The red dots represent the average values.

Biological variation in 30-45 cm Cod (*Gadus morhua*) from Icelandic waters in March 1990-2007

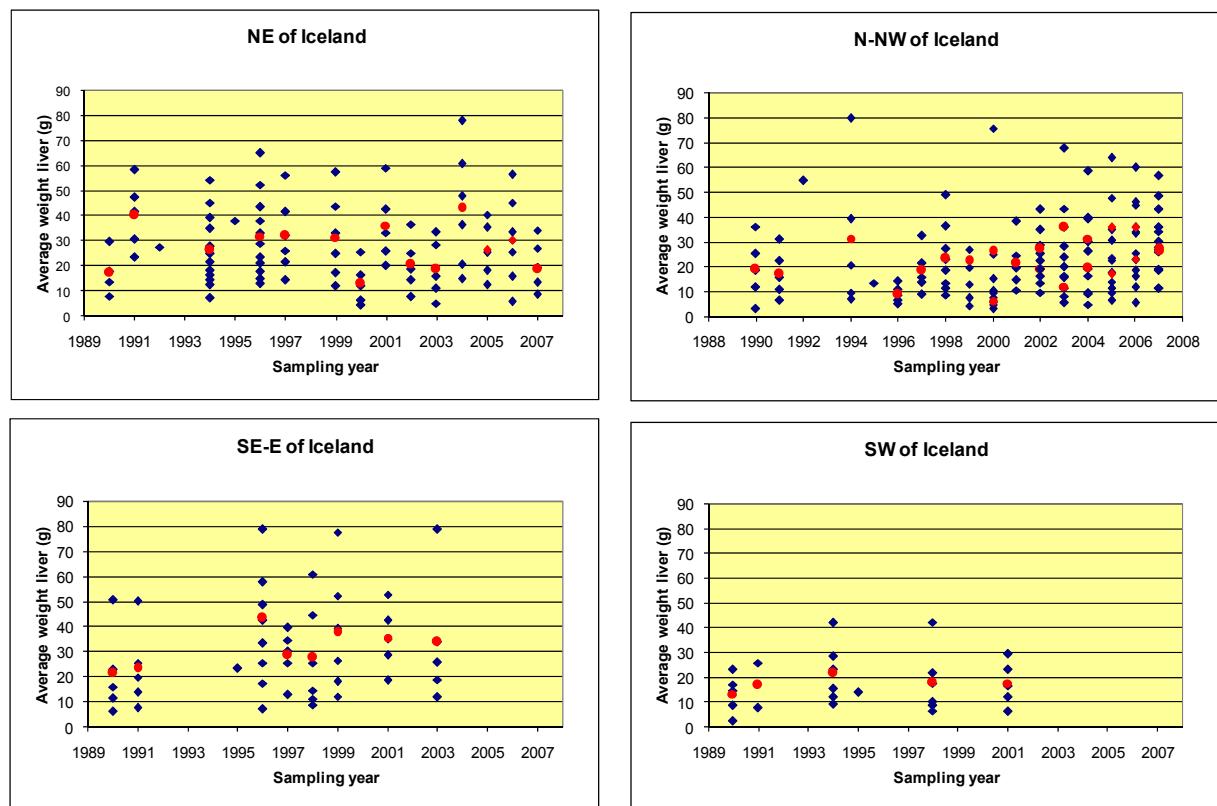

Figure 2c. Average weight liver of Cod (*Gadus morhua*), 30-45 cm, from Icelandic waters in March 1990-2007. The red dots represent the average values.

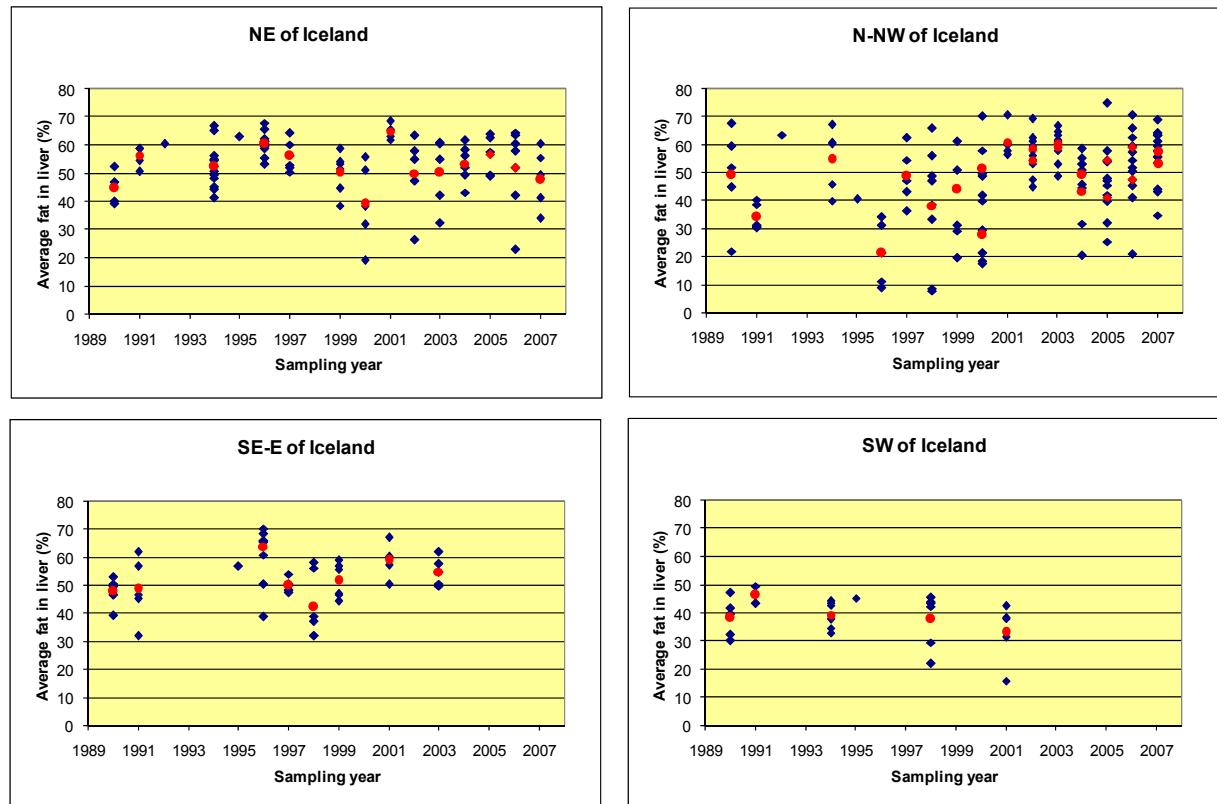

Figure 2d. Average fat (%) in liver of Cod (*Gadus morhua*), 30-45 cm, from Icelandic waters in March 1990-2007. The red dots represent the average values.

Appendix VII.

**Graphs of metals and organic compounds in
Blue mussel (*Mytilus edulis*) 1990-2006**

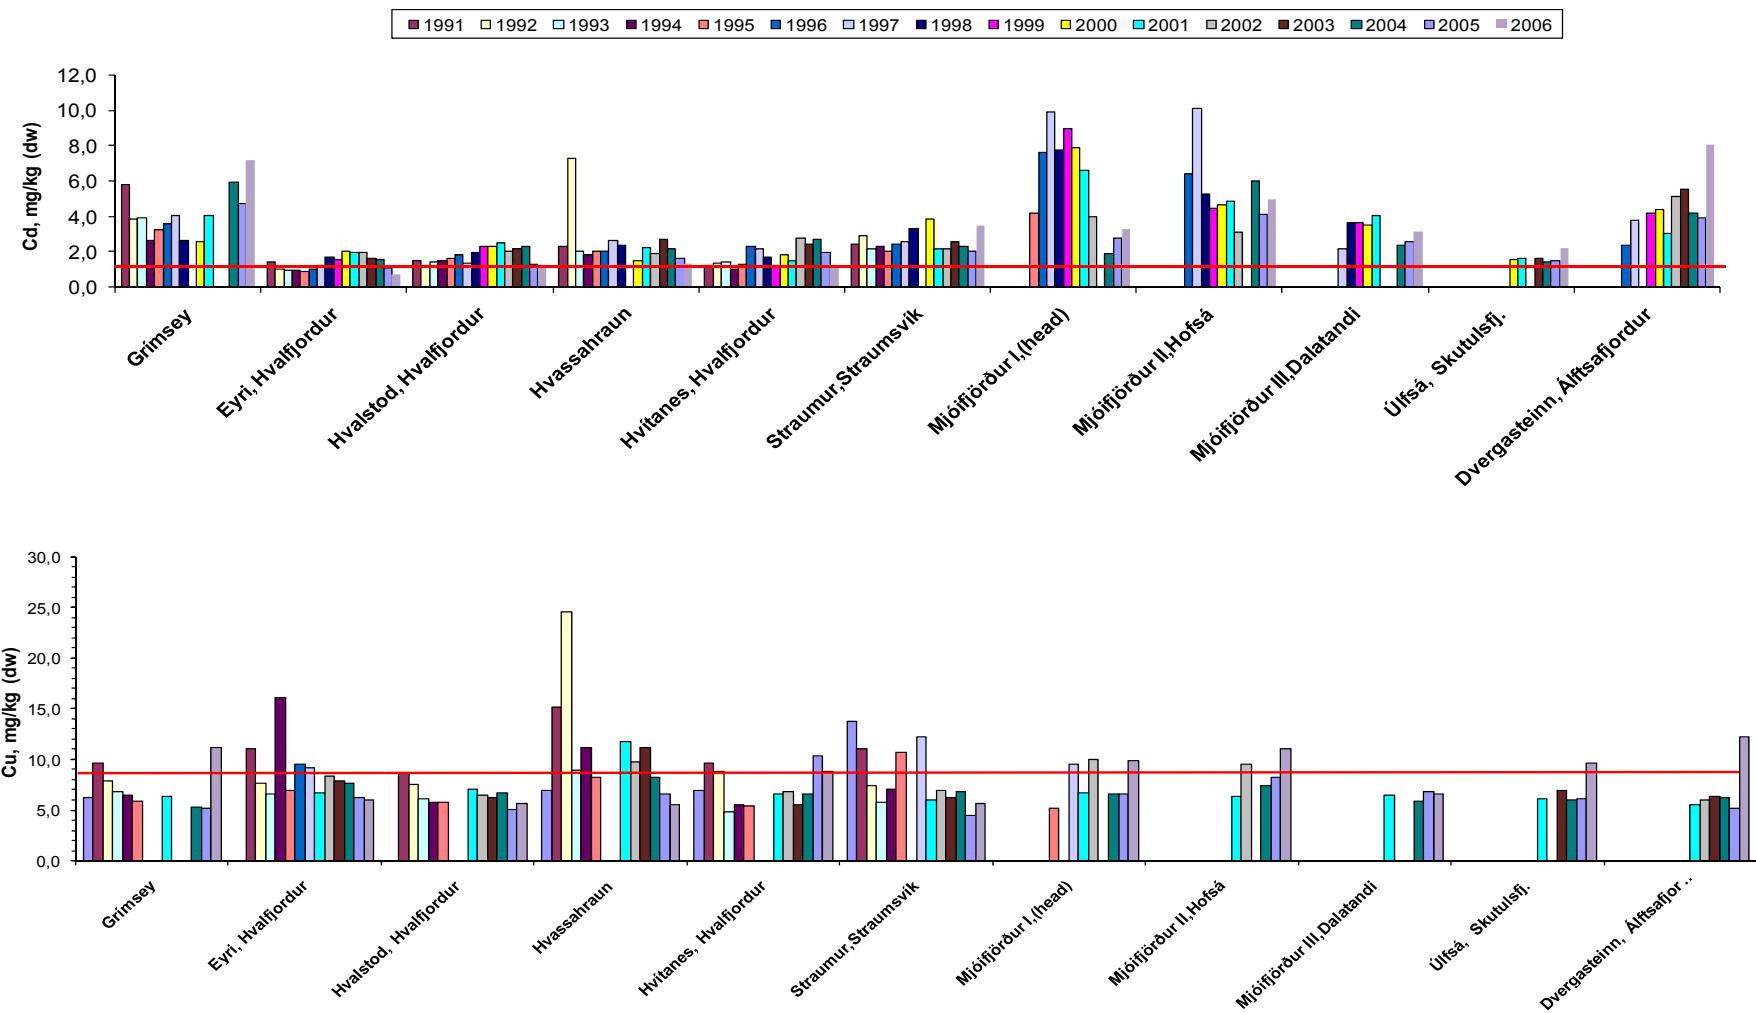

Figure 3a. Cadmium and copper concentration (dw) in Blue mussel (*Mytilus edulis*) around Iceland 1990-2006. Red line indicates ICES 90 75% baseline (11).

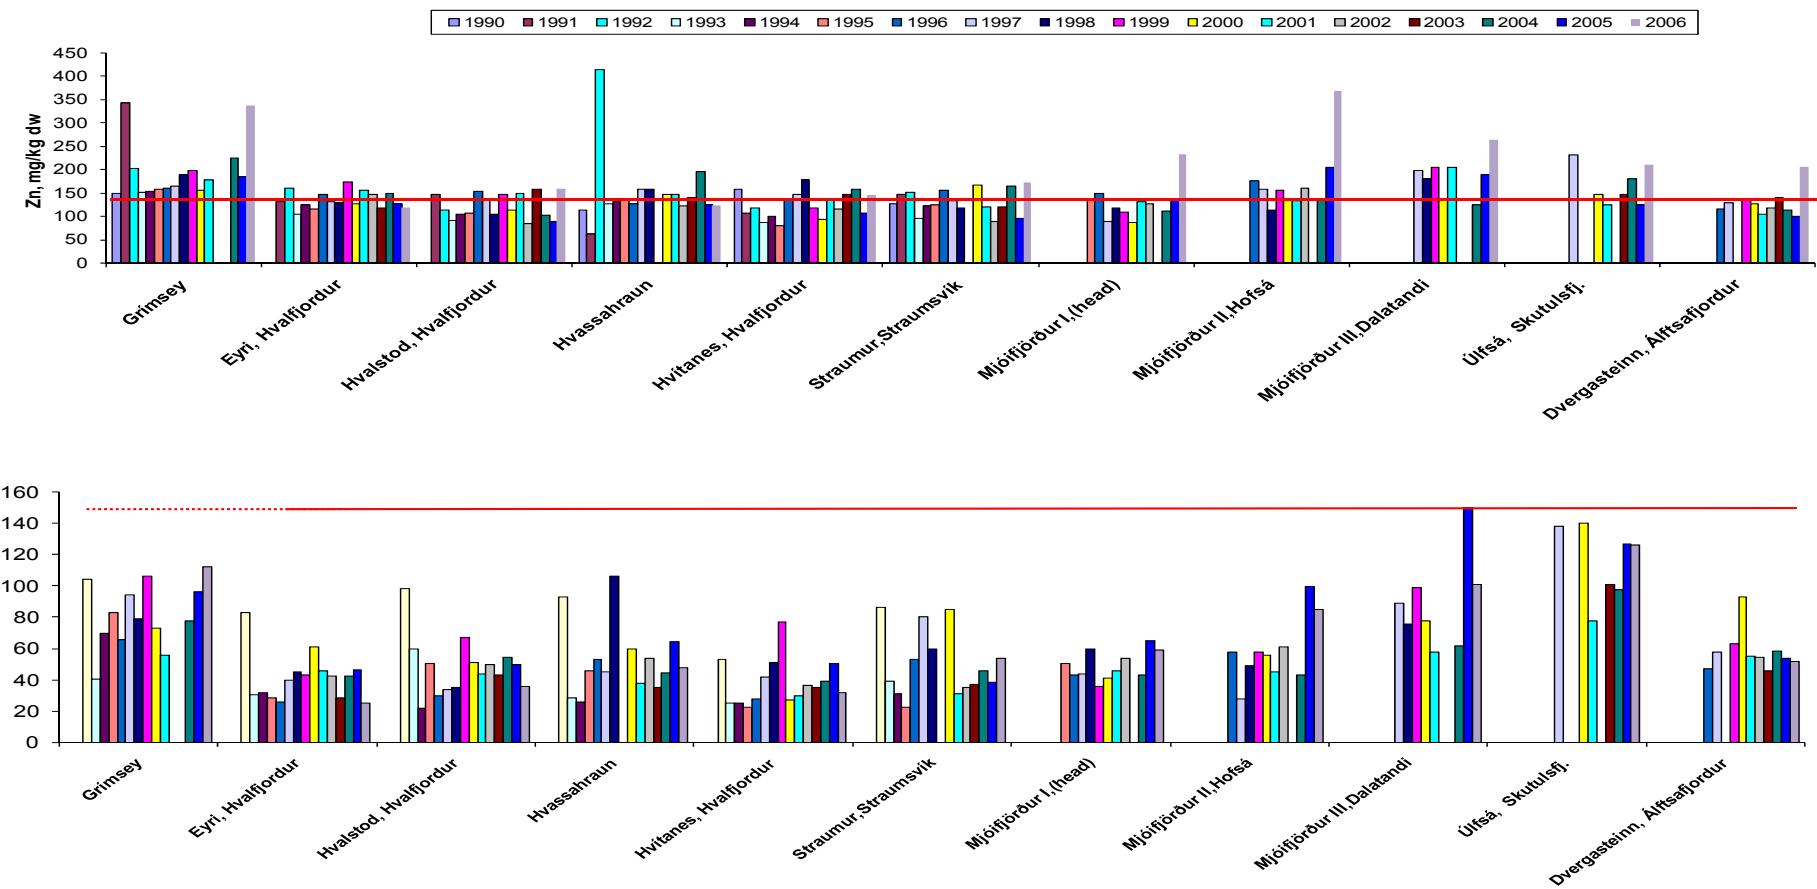

Figure 3b. Zinc and mercury concentration (dw) in Blue mussel (*Mytilus edulis*) around Iceland 1990-2006. Red line indicates ICES 90 75% baseline (11).

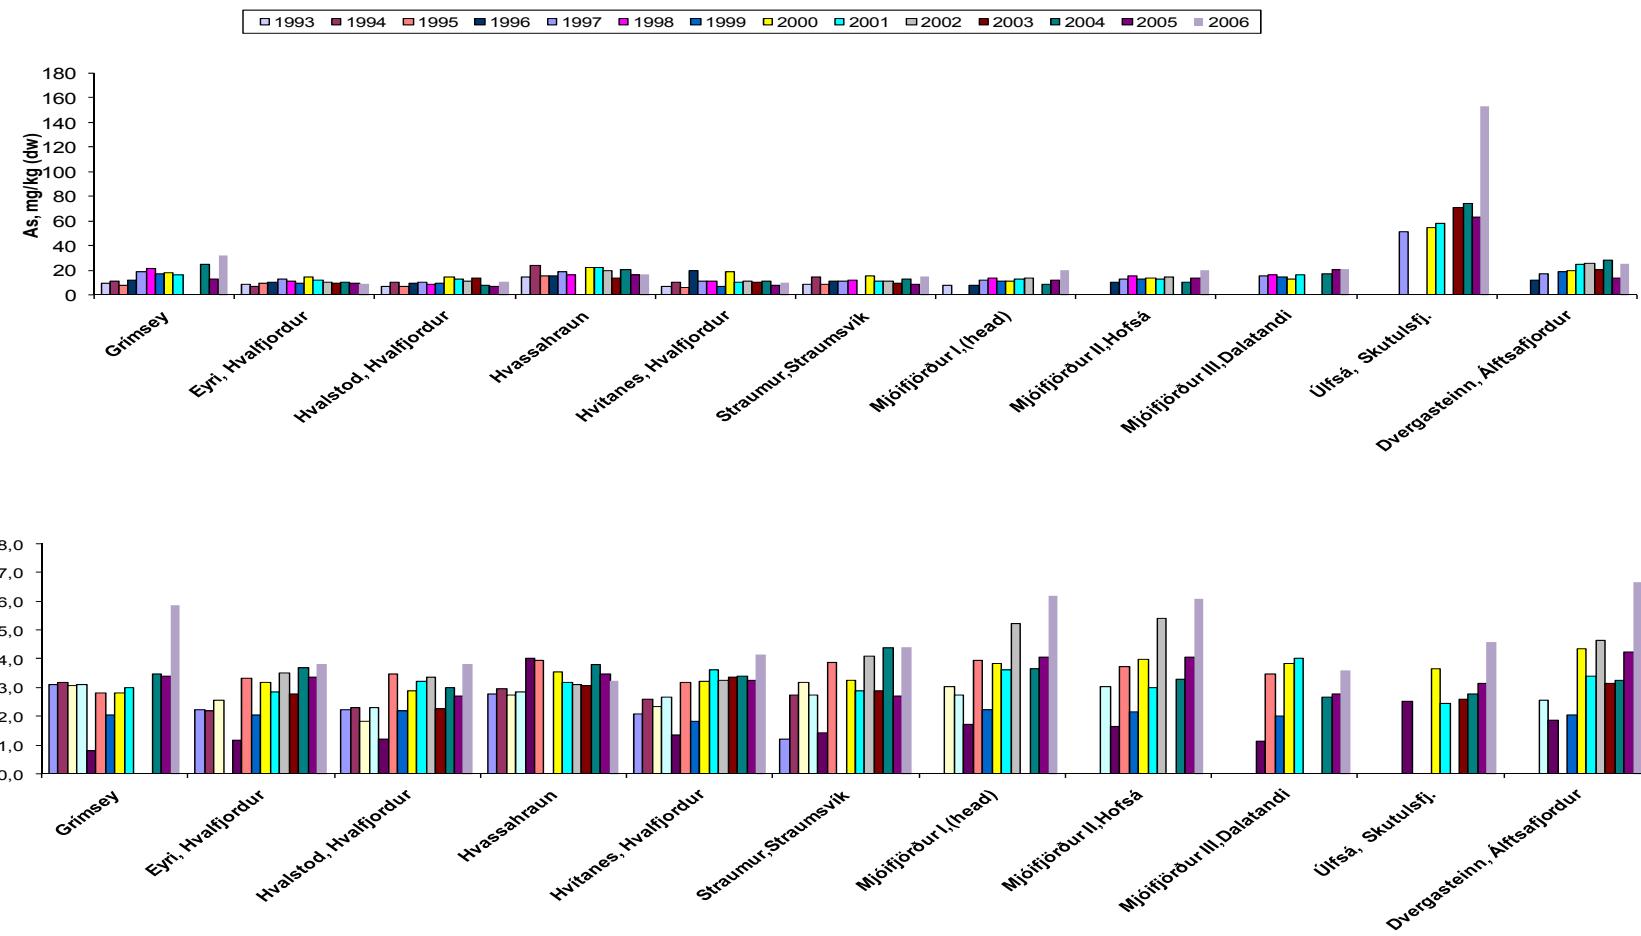

Figure 3c. Arsenic and selenium concentration (dw) in Blue mussel (*Mytilus edulis*) around Iceland 1990-2006.

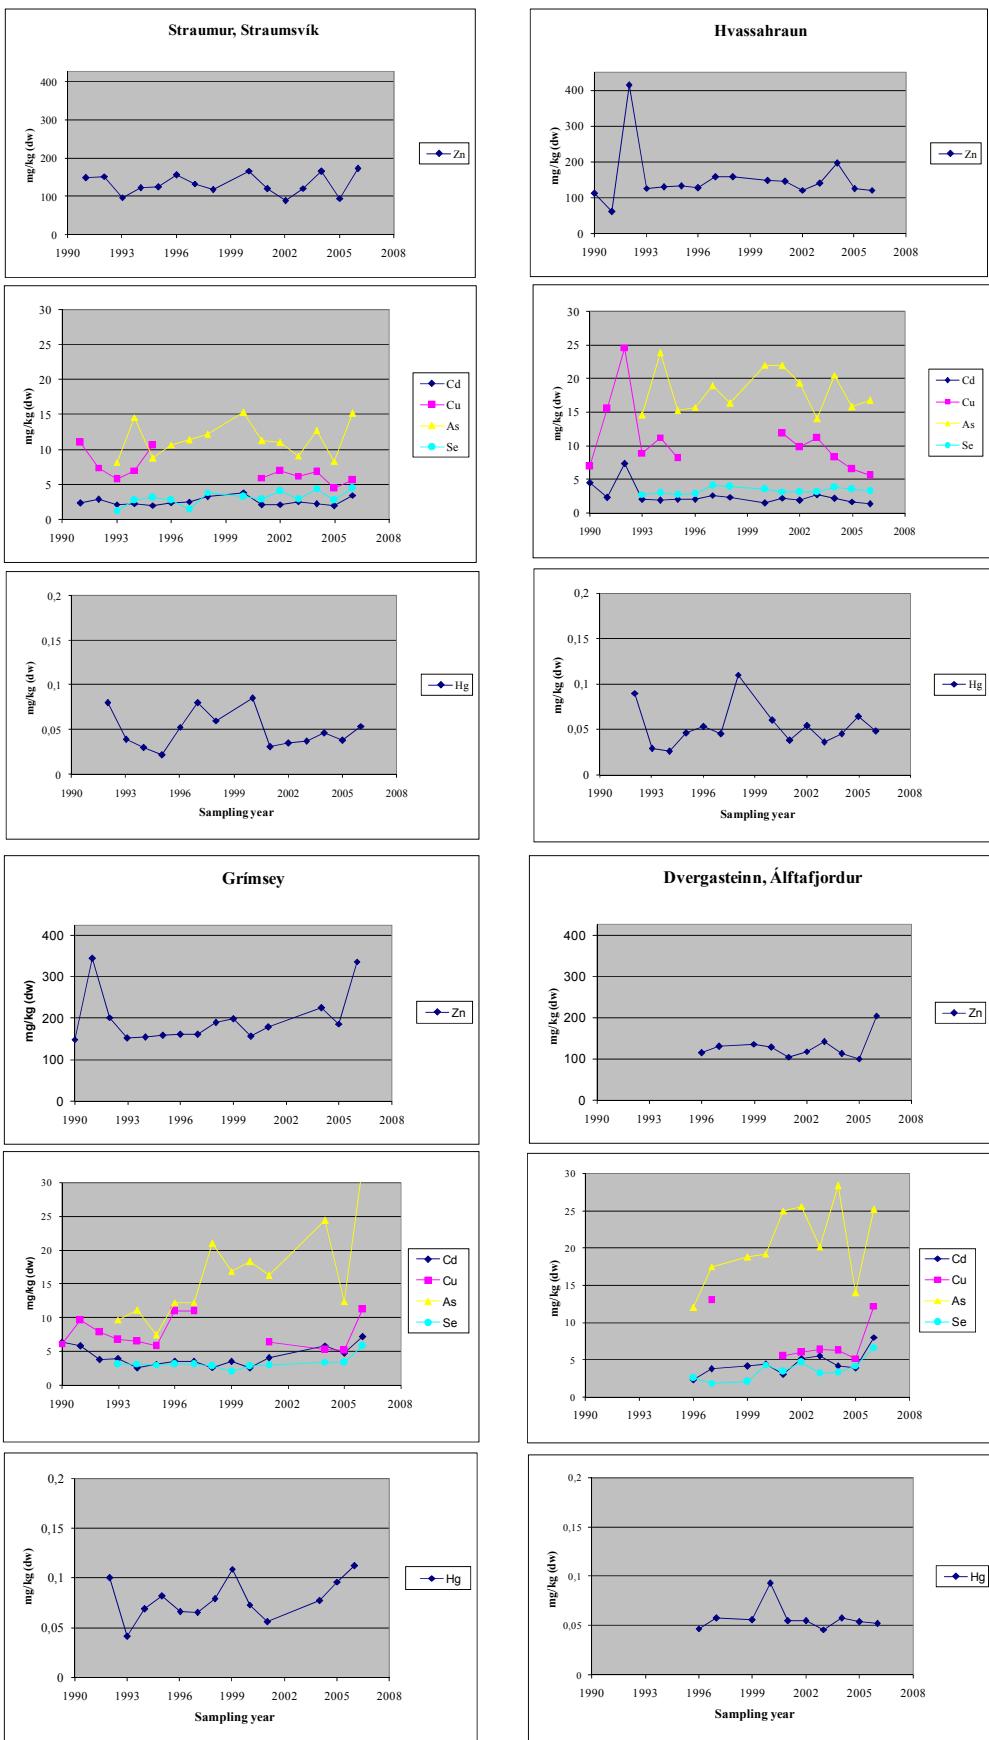

Figure 4a. Concentration of heavy metals (dry weight) in Blue mussel from different sampling sites around Iceland, 1991-2006.

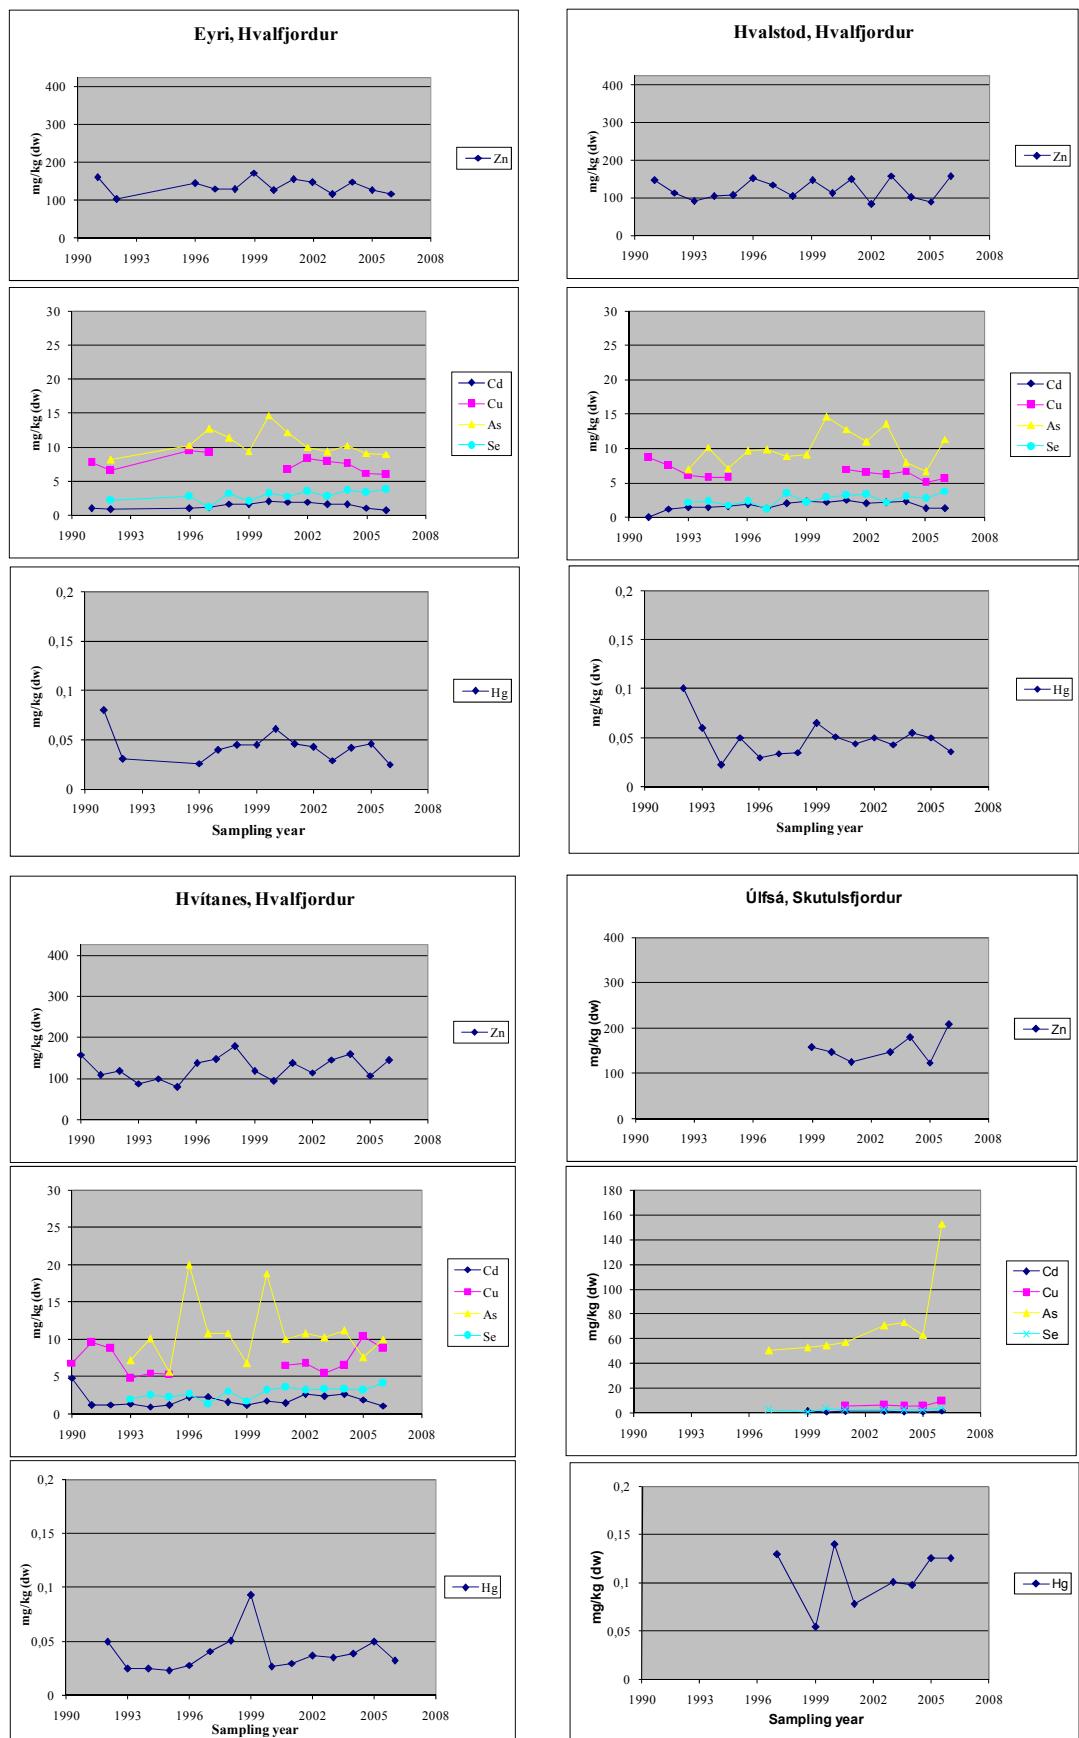

Figure 4b. Concentration of heavy metals (dry weight) in Blue mussel from different sampling sites around Iceland, 1991-2006.

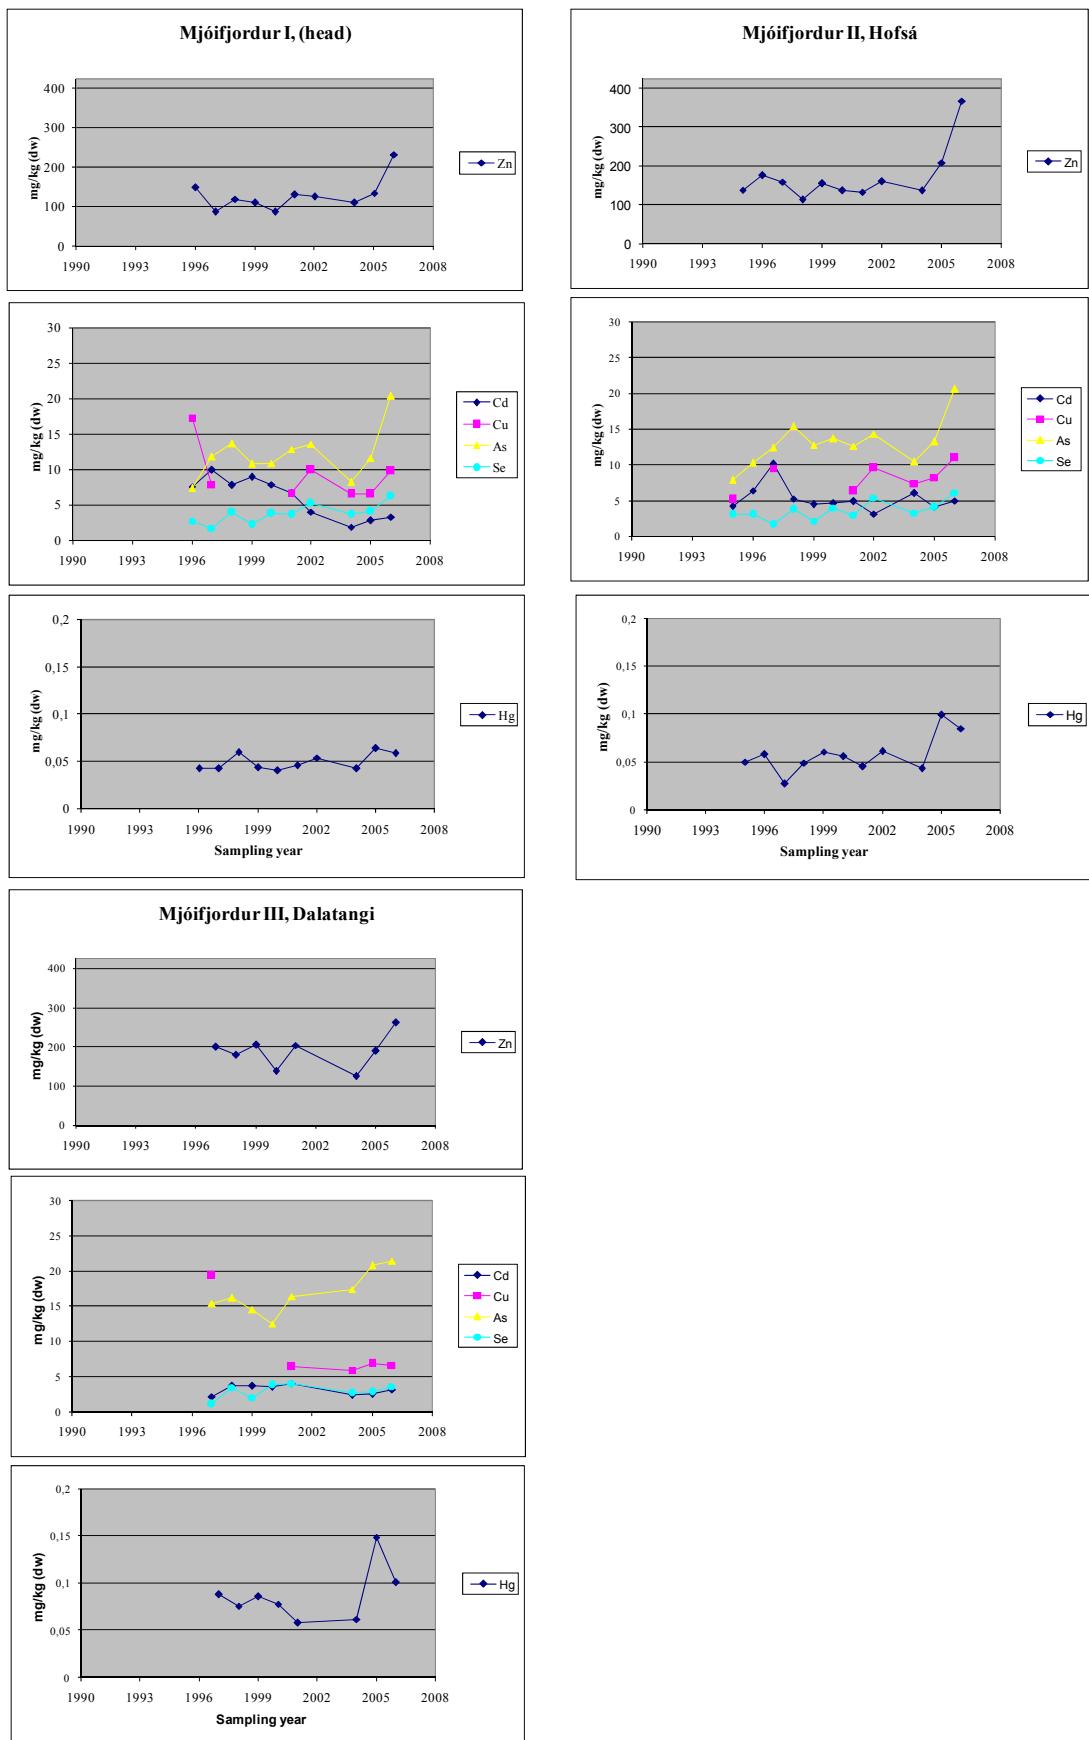

Figure 4c. Concentration of heavy metals (dry weight) in Blue mussel from different sampling sites around Iceland, 1991-2006.

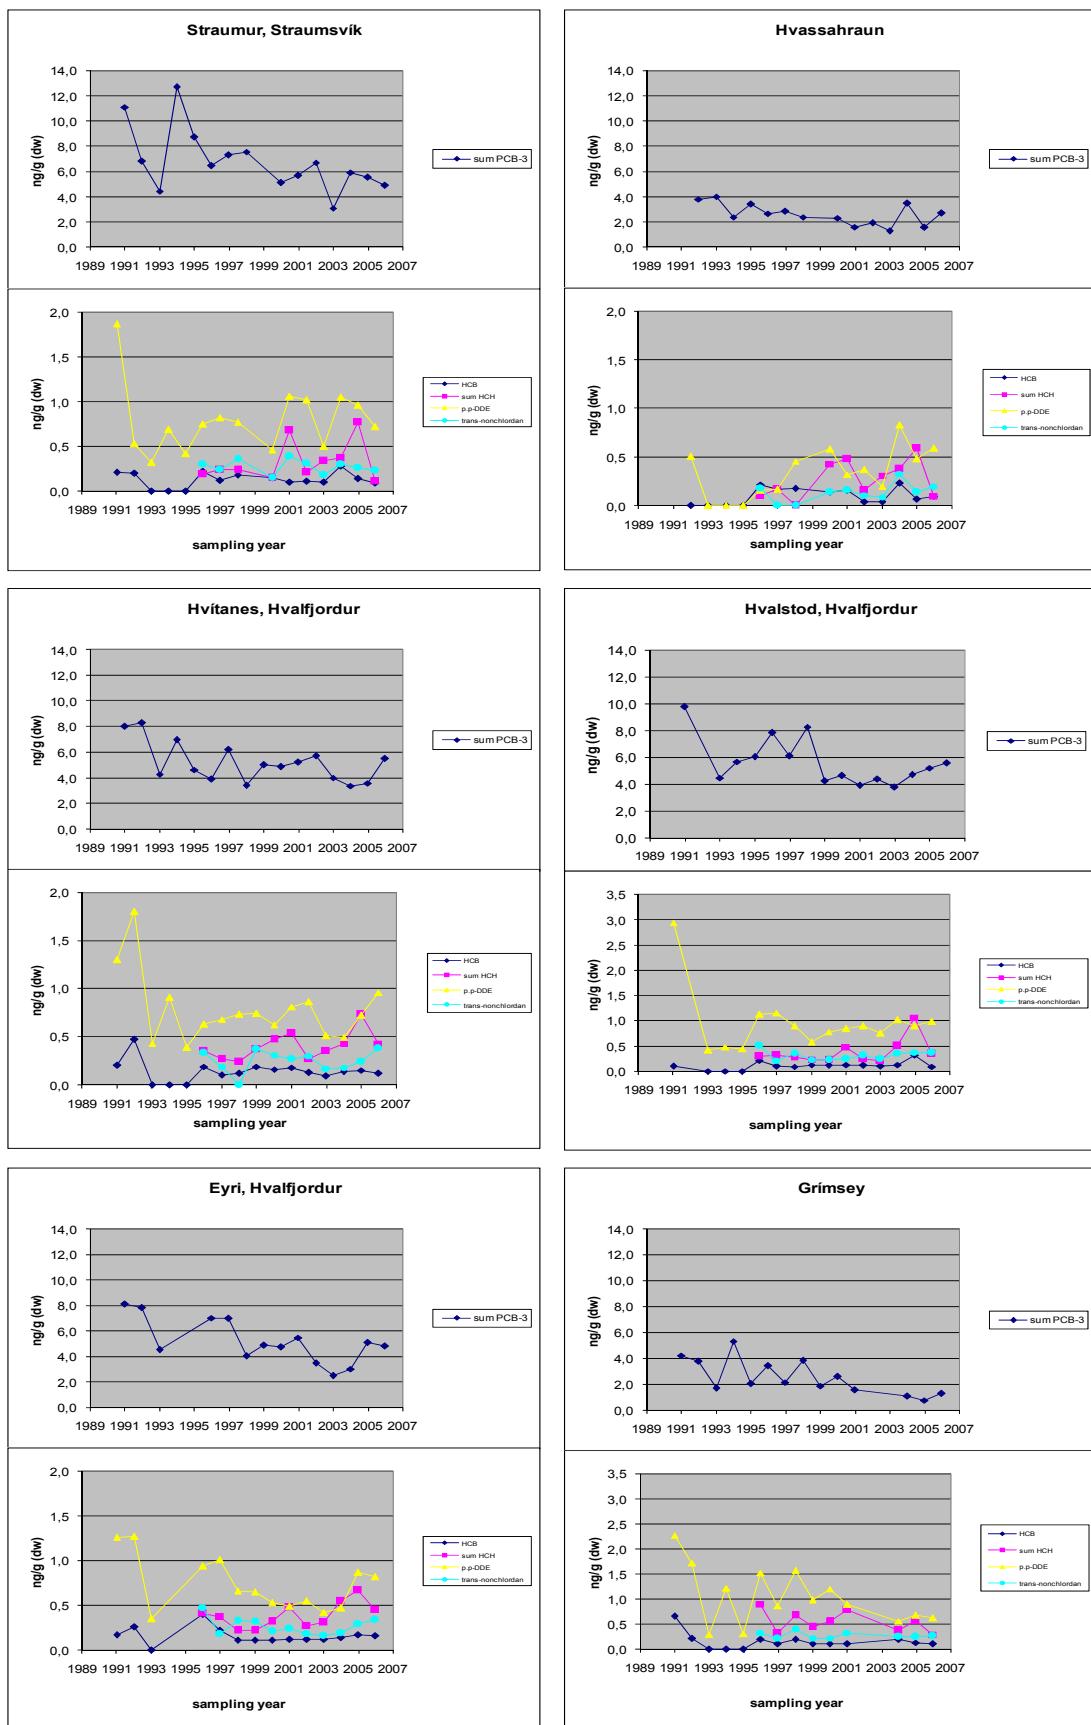

Figure 5a. Concentration of organochlorine compounds (dw) in Blue mussel (*Mytilus edulis*) at different locations 1991-2006.

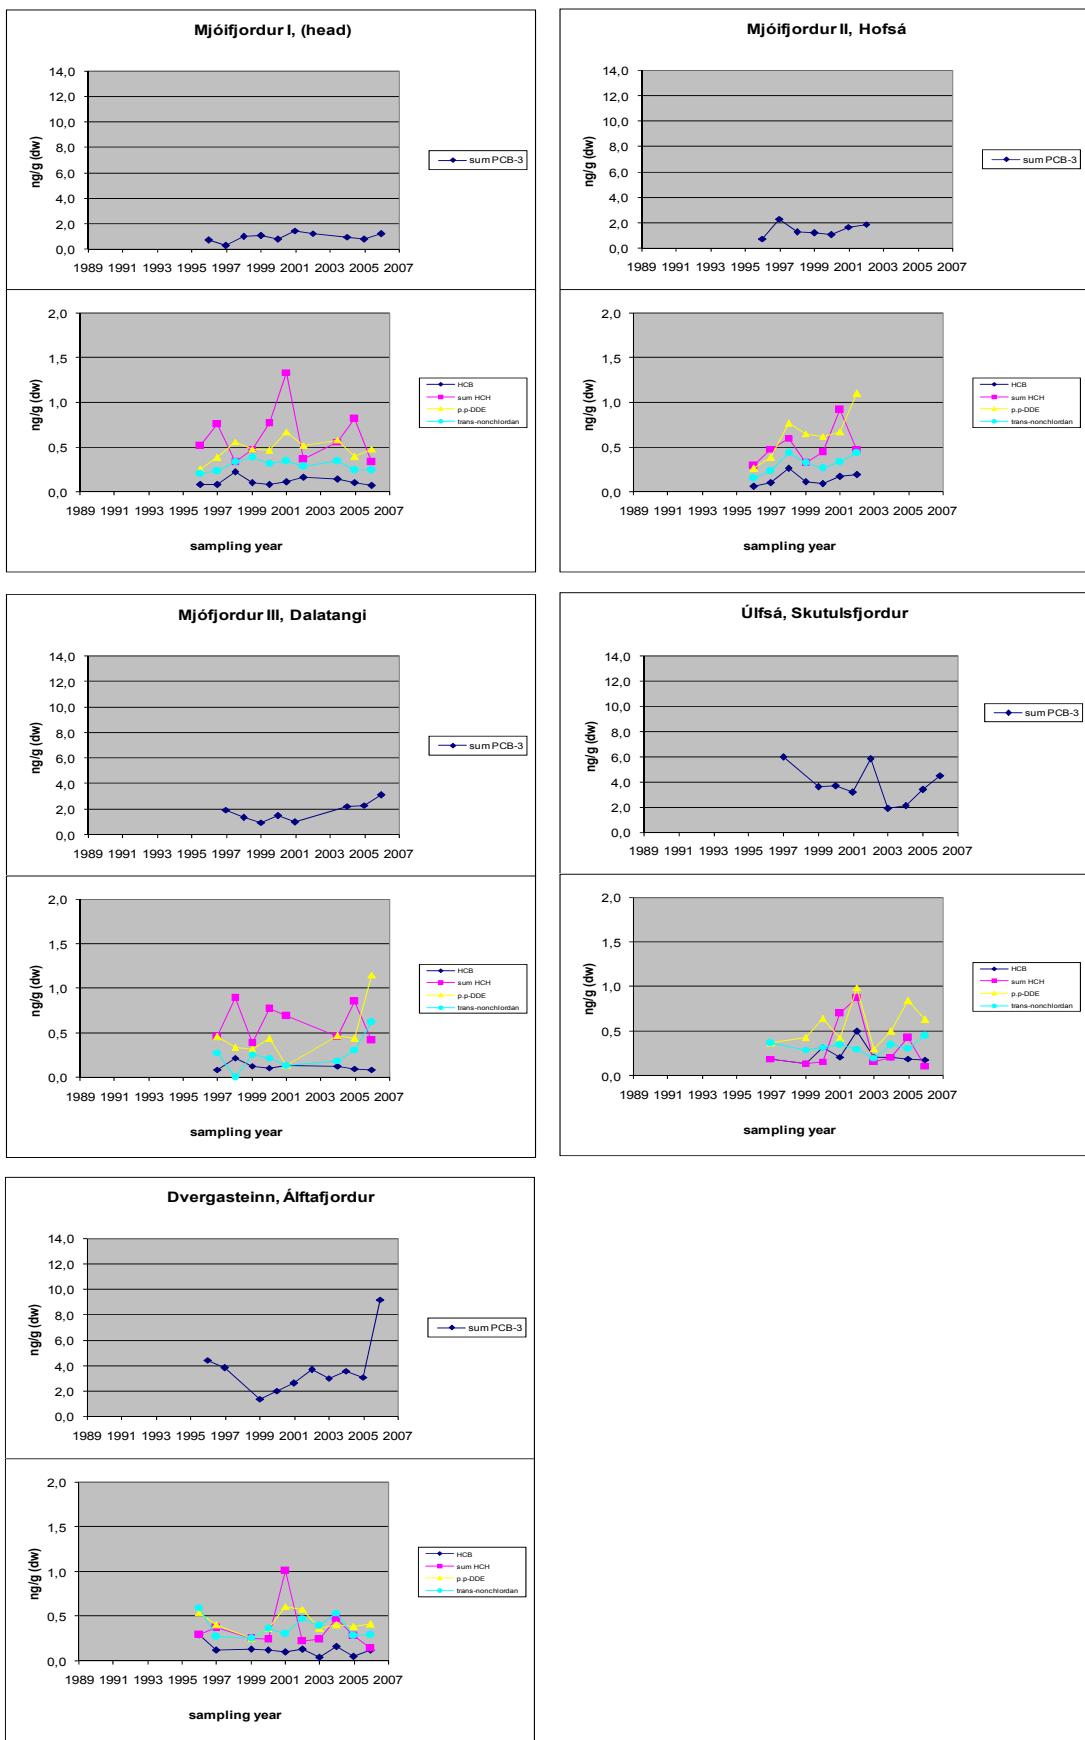

Figure 5b. Concentration of organochlorine compounds (dw) in Blue mussel (*Mytilus edulis*) at different locations 1991-2006.

Appendix VIII.

**Graphs of metals and organic compounds in
Cod (*Gadus morhua*) 1990-2007**

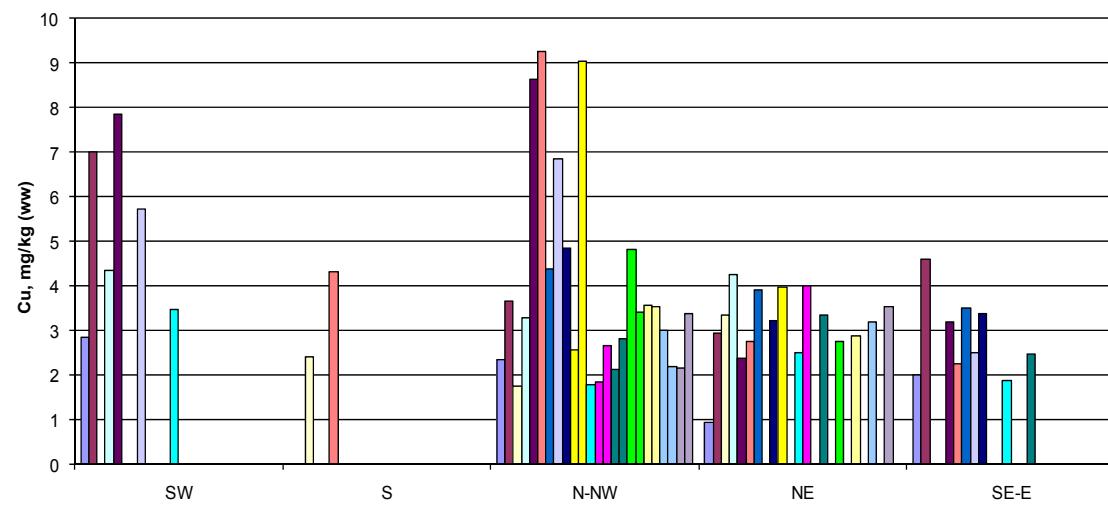

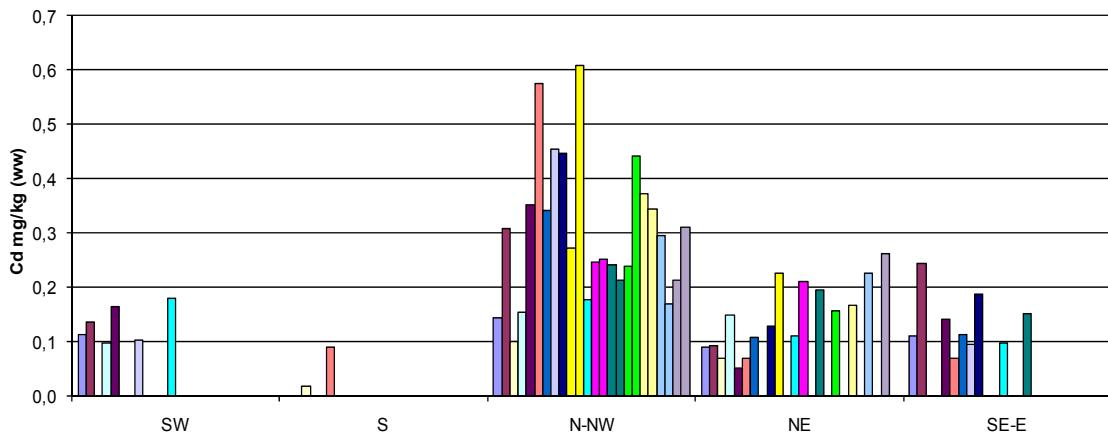

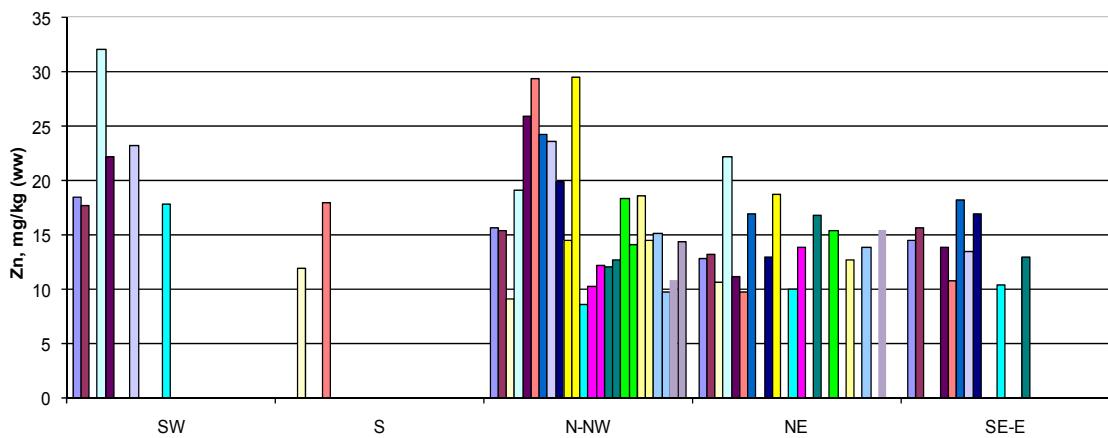

Figure 6a. Heavy metal concentration (ww) in livers of 30-45cm cod (*Gadus morhua*) from Icelandic waters in March 1990-2007.

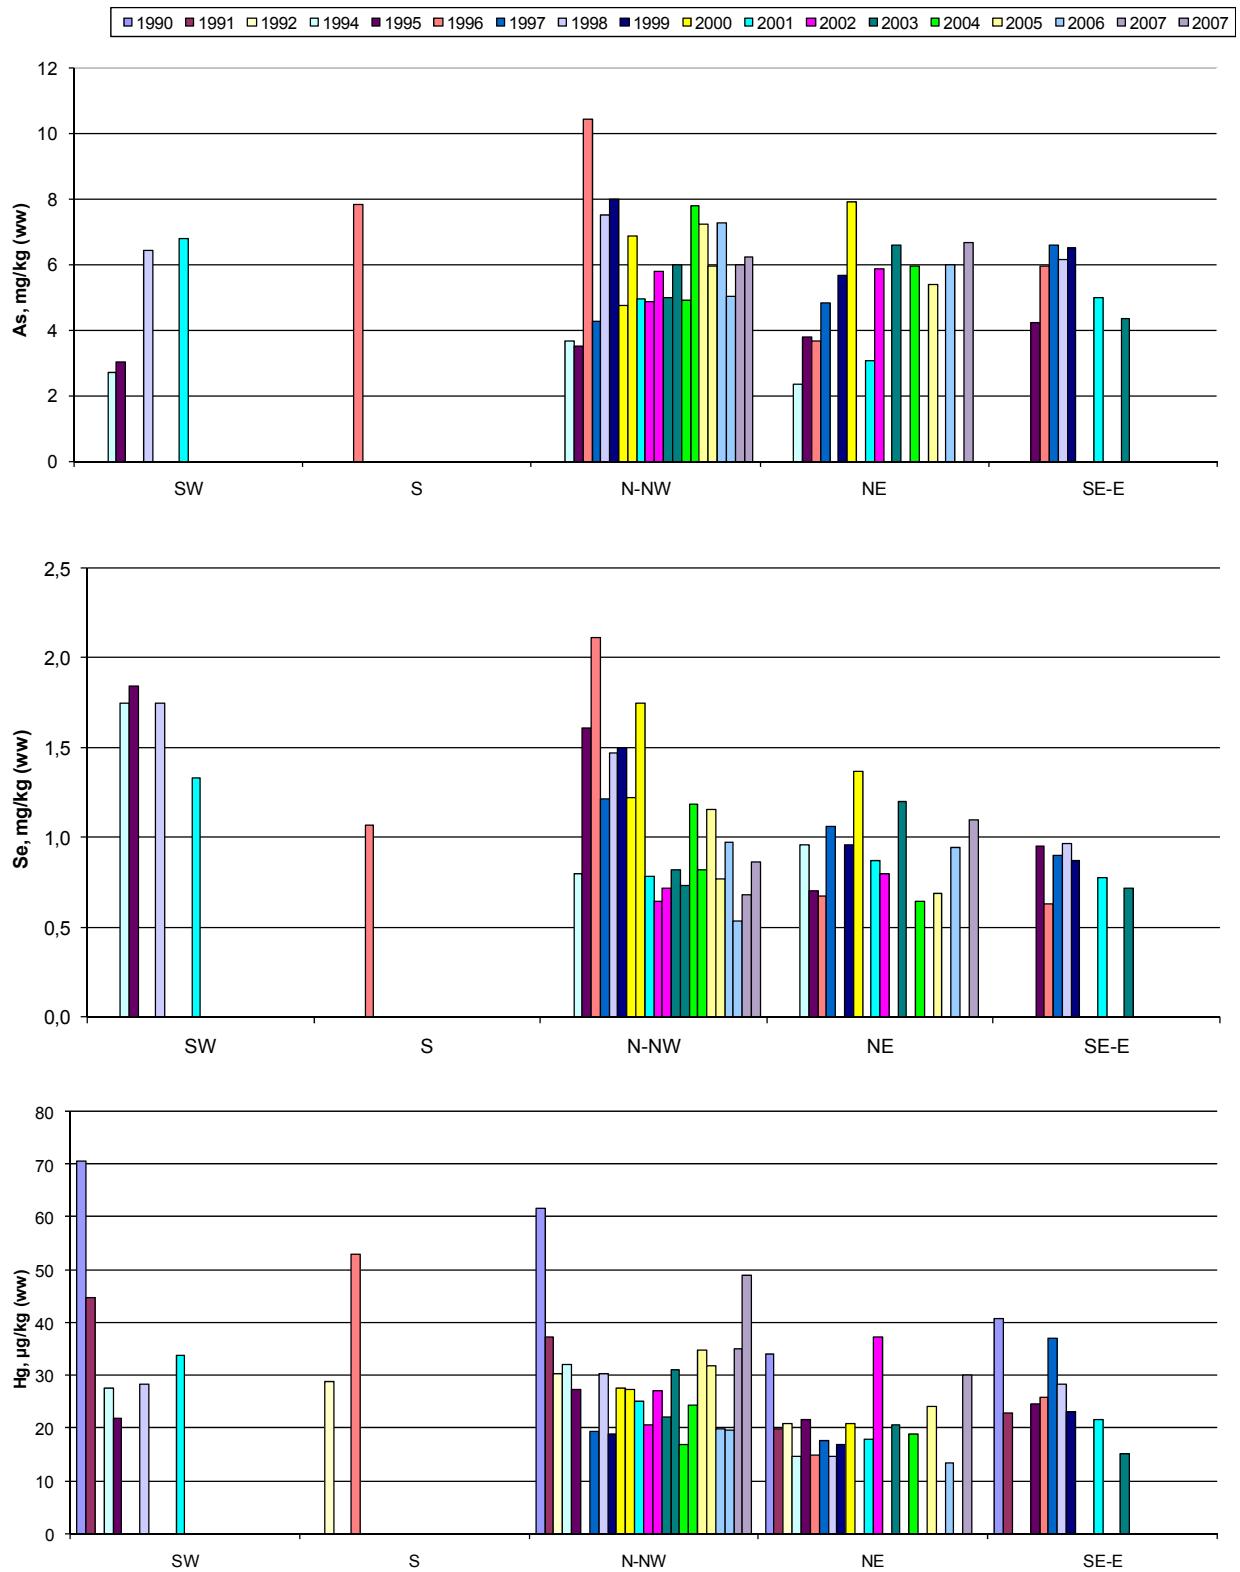

Figure 6b. Heavy metal concentration (ww) in livers of 30-45cm cod (*Gadus morhua*) from Icelandic waters in March 1990-2007. Mercury (Hg) was analysed in the flesh.

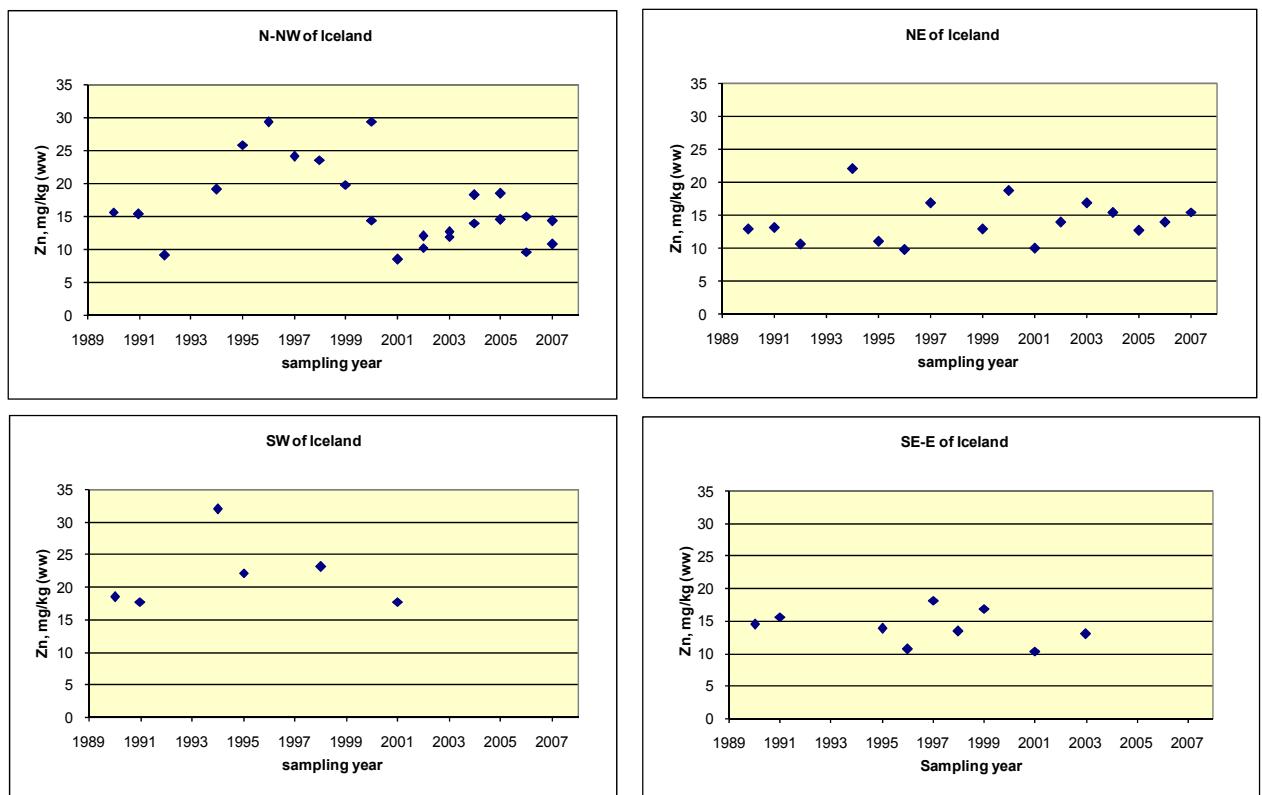

Figure 7a. Average concentration of Zinc (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

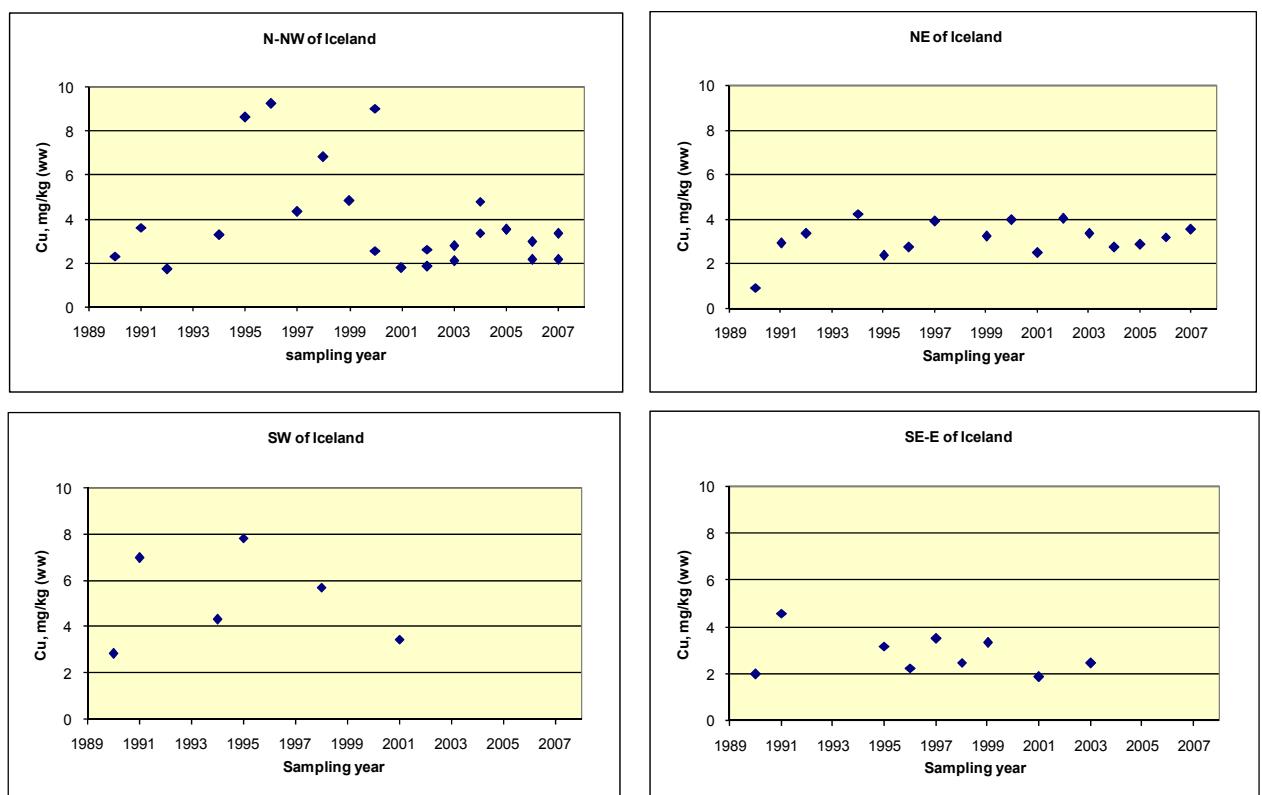

Figure 7b. Average concentration of Copper (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

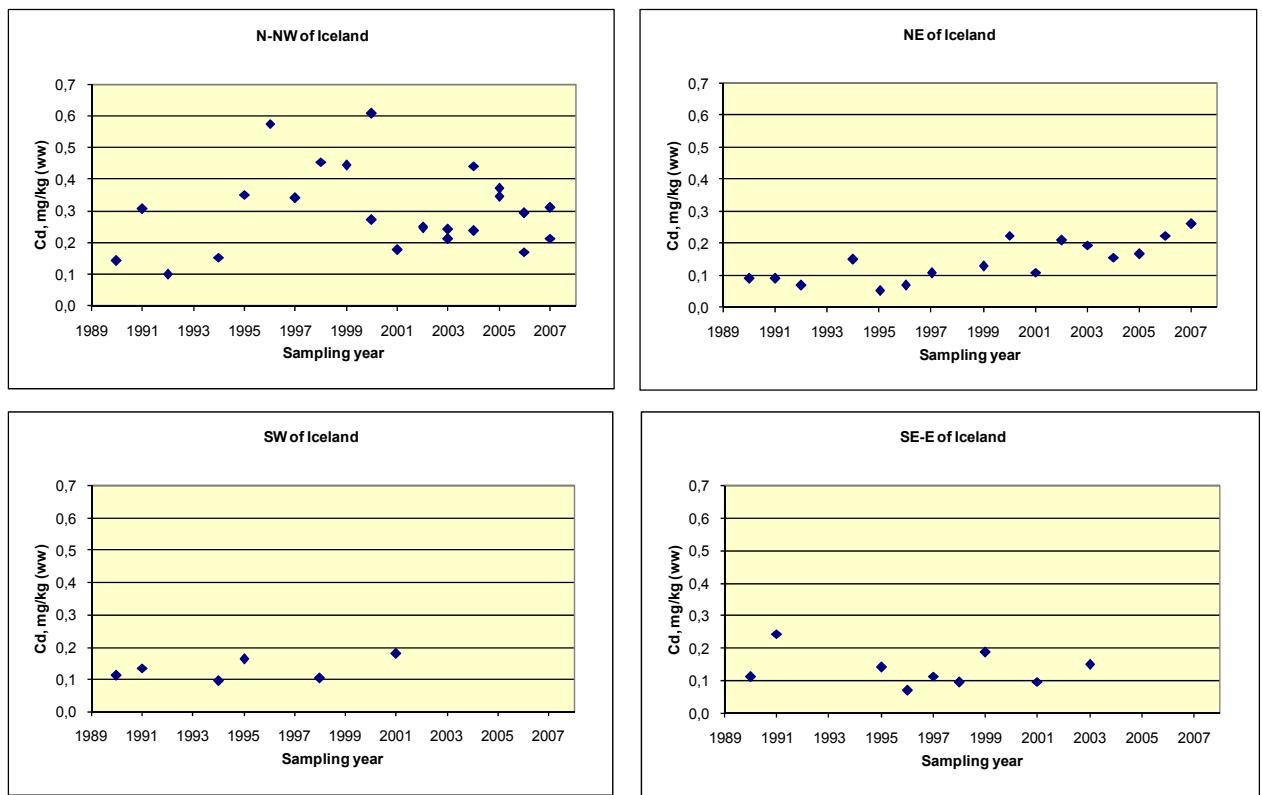

Figure 7c. Average concentration of Cadmium (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

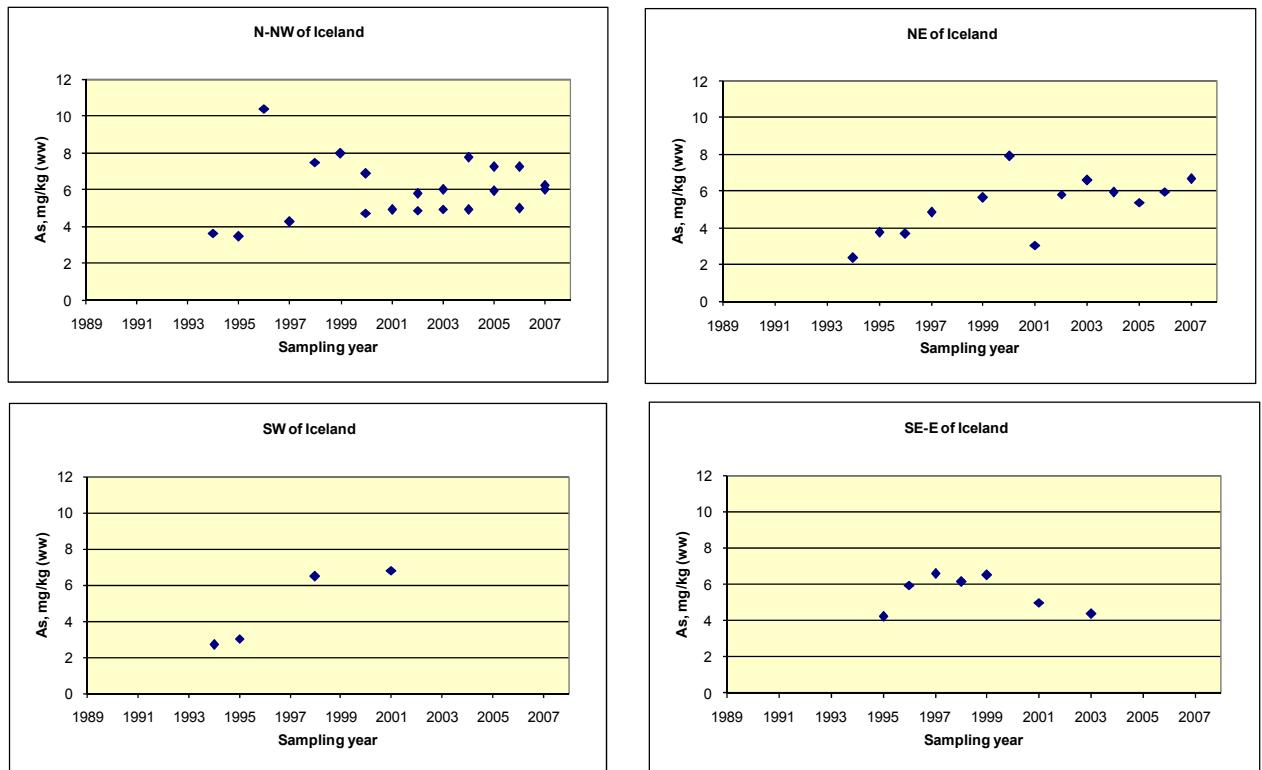

Figure 7d. Average concentration of Arsenic (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

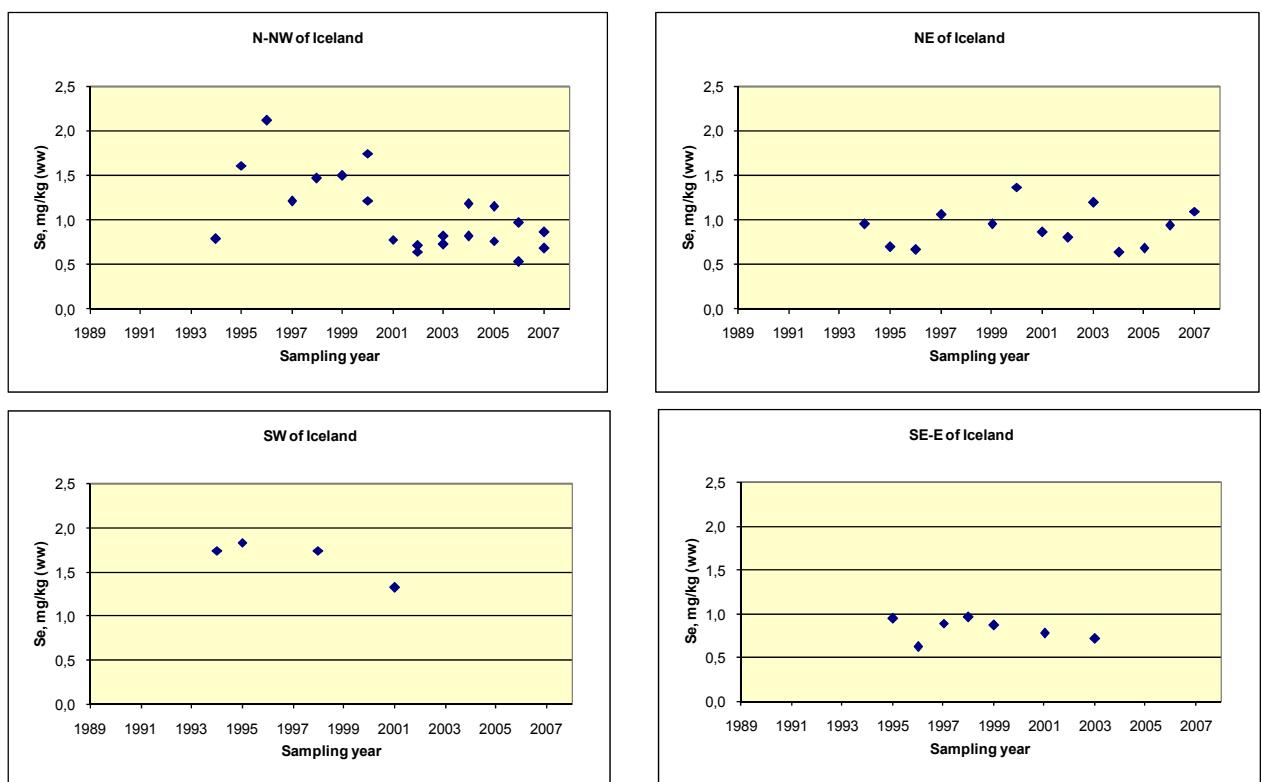

Figure 7e. Average concentration of Selenium (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

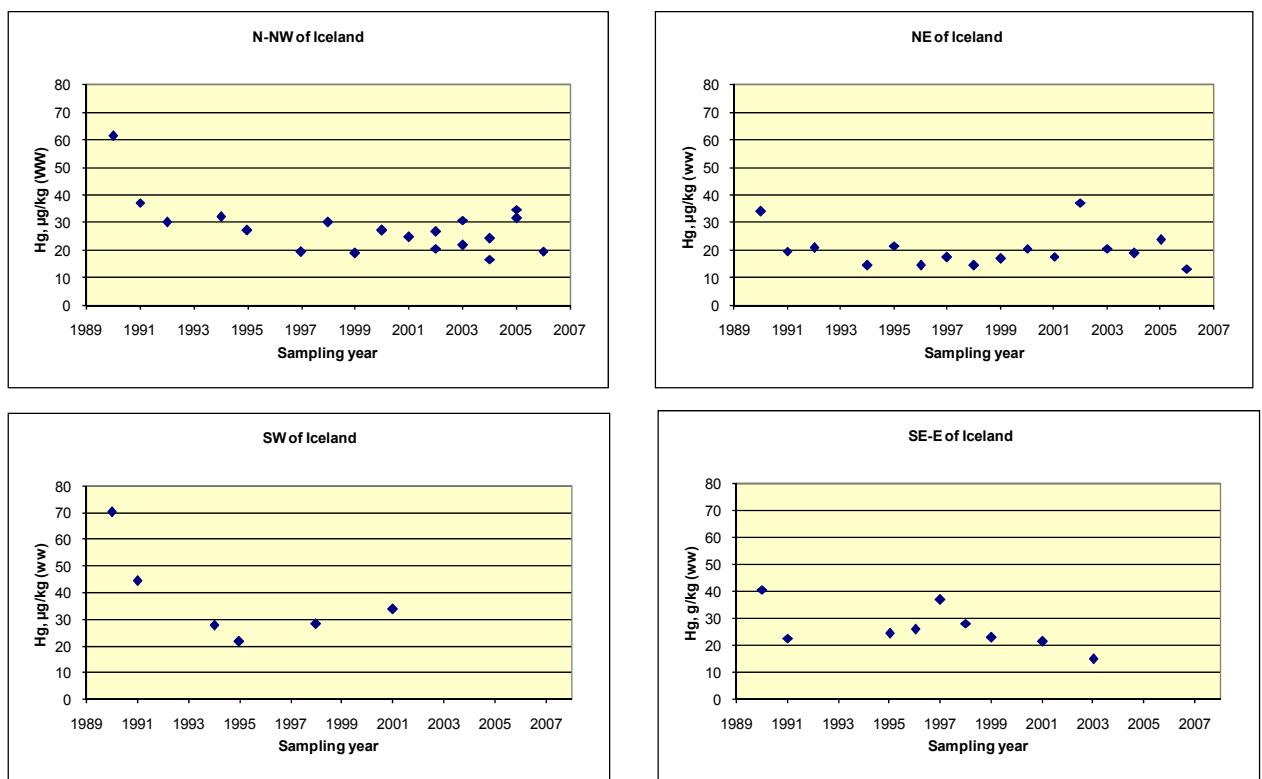

Figure 7f. Average concentration of Mercury (ww) in flesh of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1990-2007.

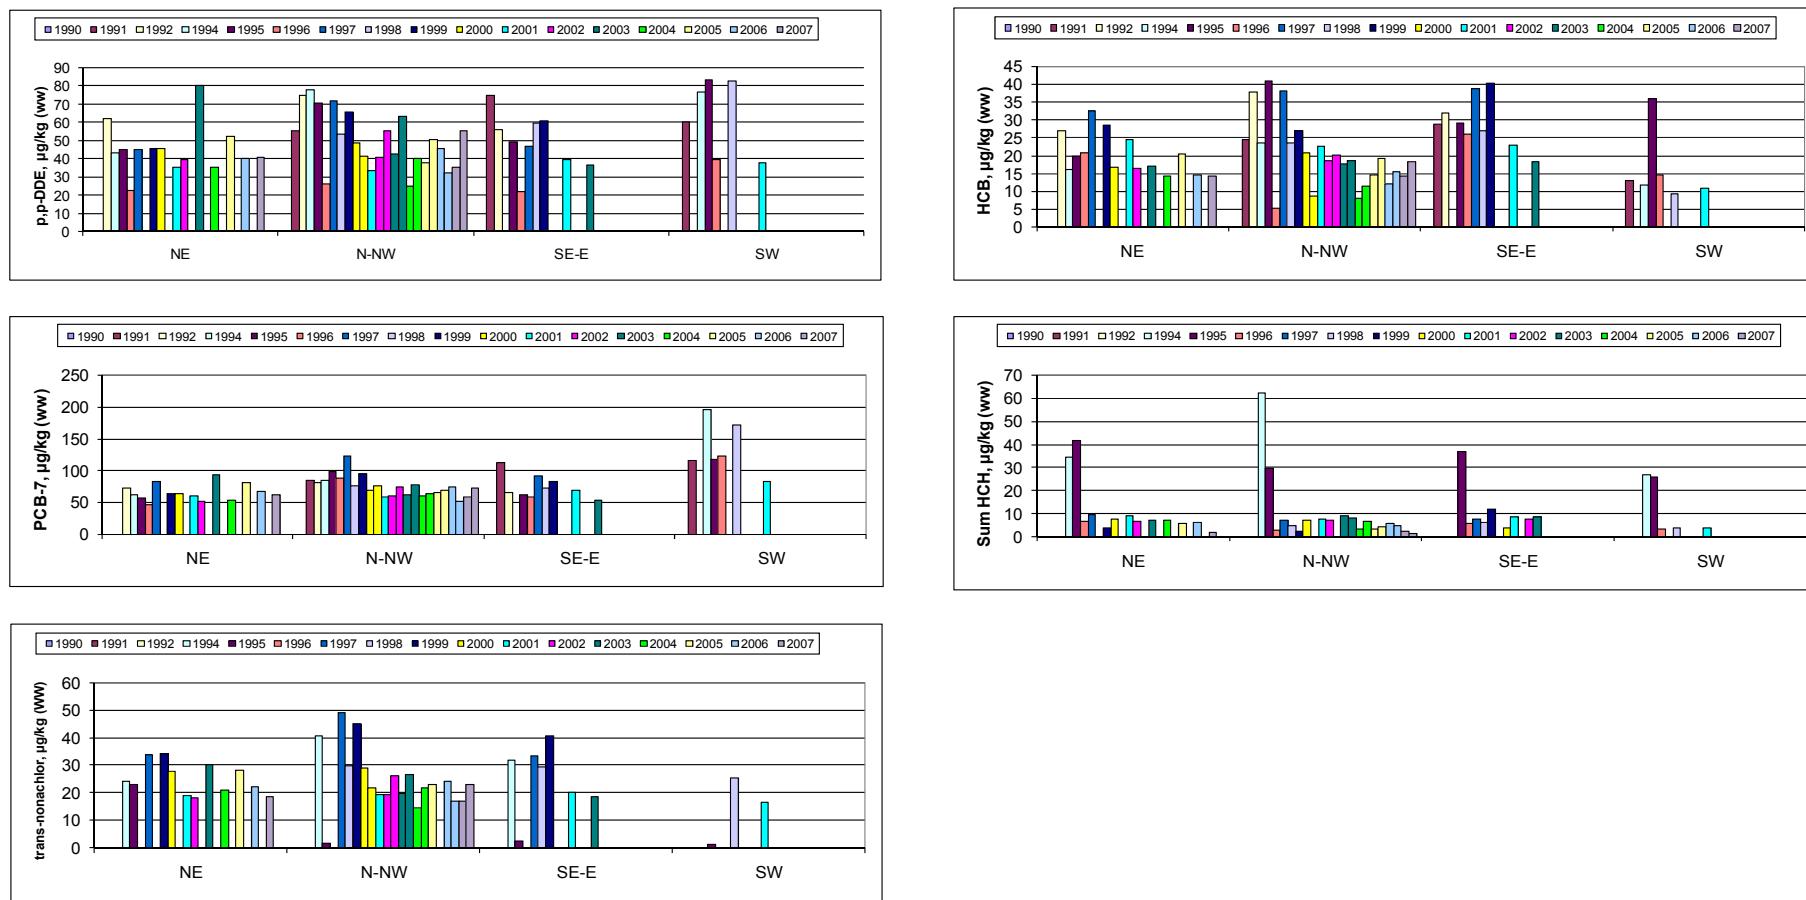

Figure 8. Average concentration of organochlorine compounds (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.

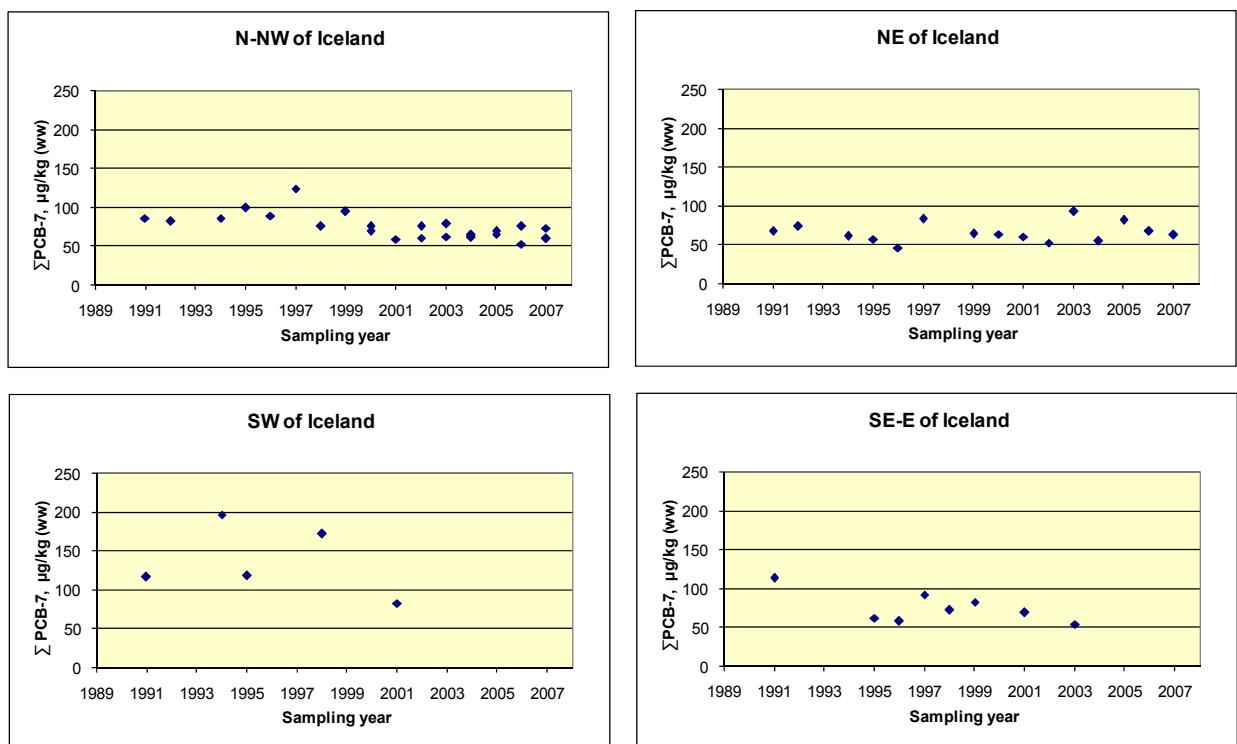

Figure 9a. Average concentration of $\Sigma\text{PCB-7}$ (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.

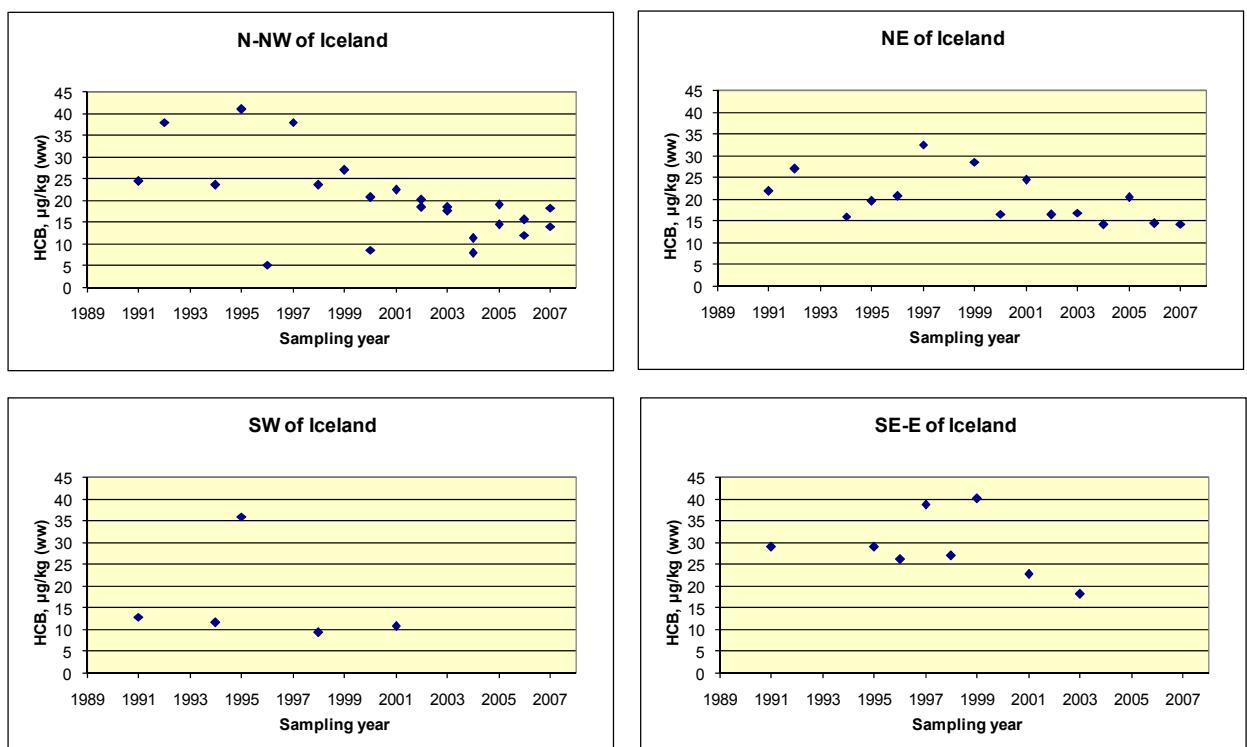

Figure 9b. Average concentration of HCB (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.

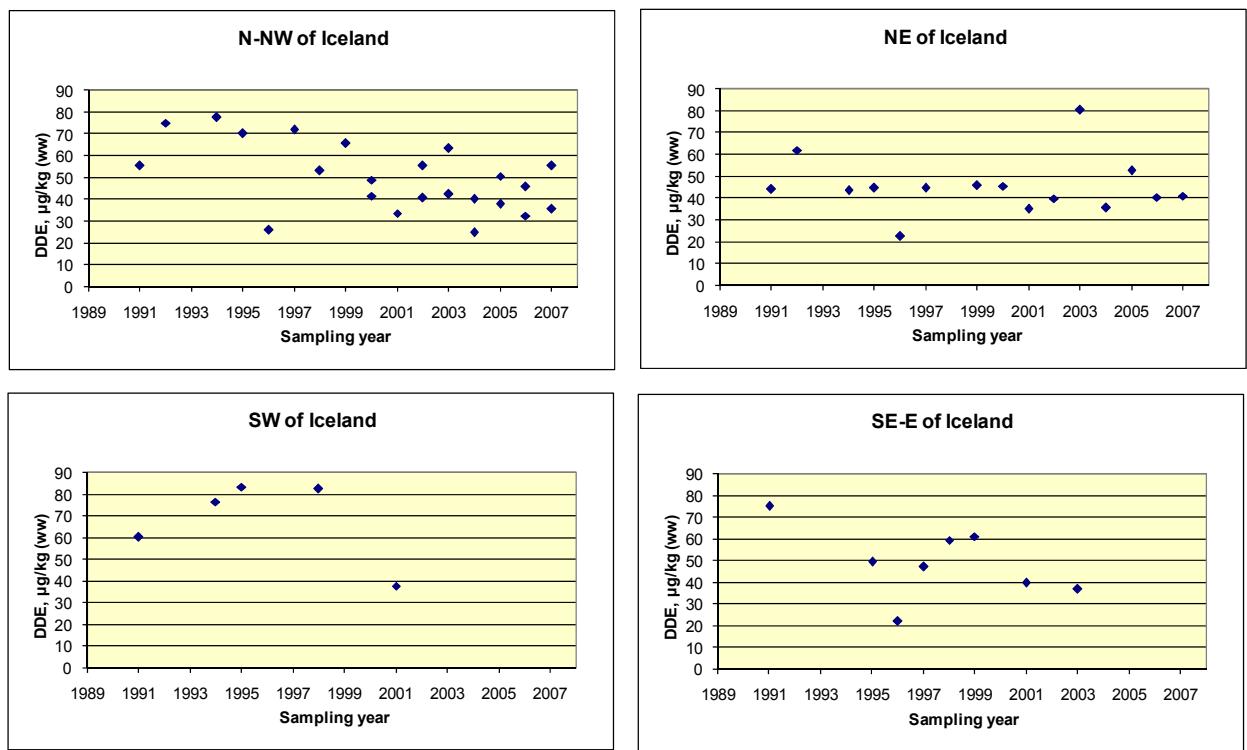

Figure 9c. Average concentration of DDE (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.

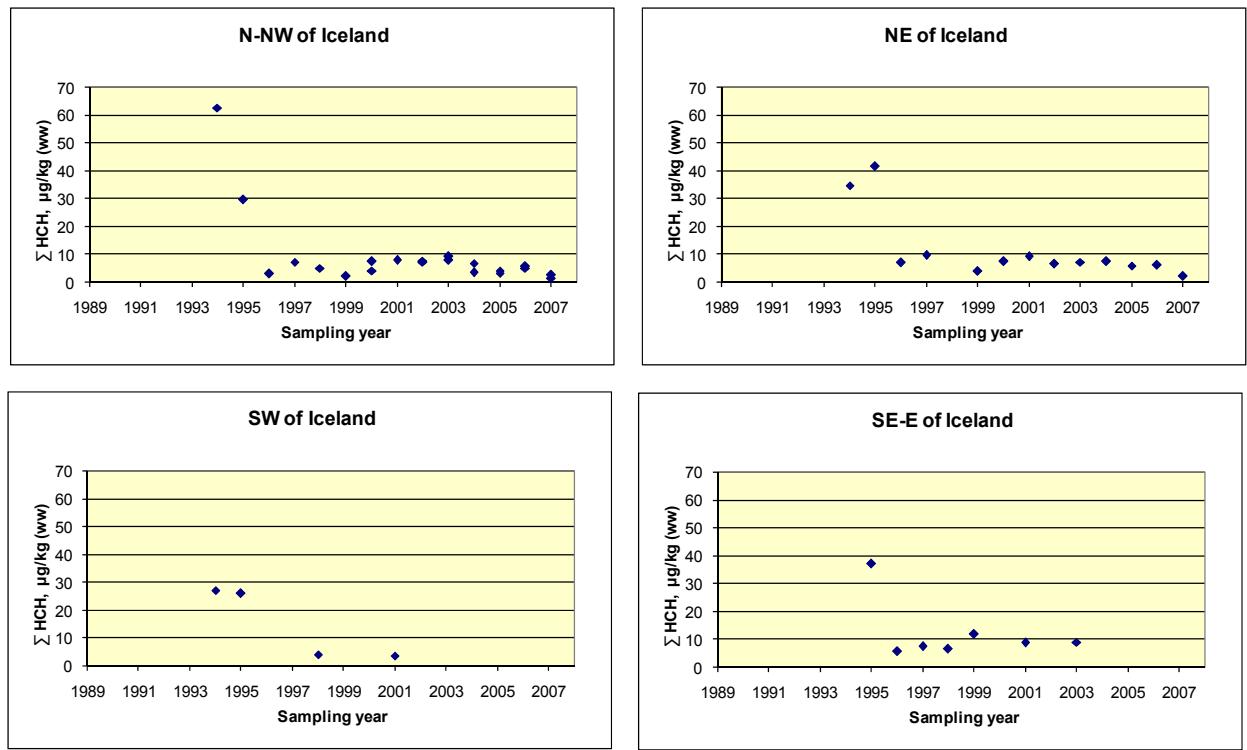

Figure 9d. Average concentration of ΣHCH (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.

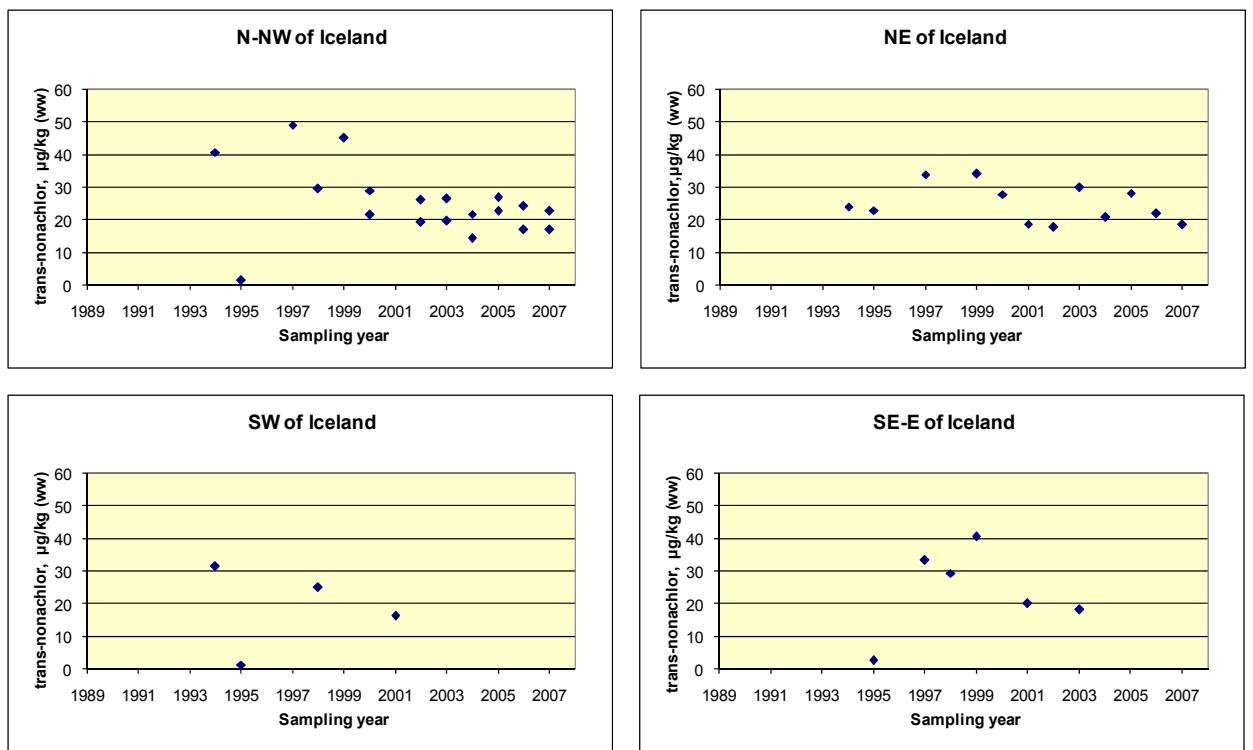

Figure 9e. Average concentration of transnonachlor (ww) in livers of 30-45 cm Cod (*Gadus morhua*) from different locations in Icelandic waters in March 1991-2007.
